Changes to the DR4 release:

1. Added photo-zs and near-IR
2. Increased the magnitude coverage to  $r < 23.5$

# Agenda

## 1. Introduction

1. Quasars in photometry

## 2. Methodology

1. Data (research and visualisation)
2. Machine learning (validation)

## 3. Results

1. Experiments
2. Final catalog (testing)

# Introduction

*Left:* quasar (in the center) and a star

*Right:* quasar and a spiral host galaxy

Active galactic nucleus (AGN)  
with jets

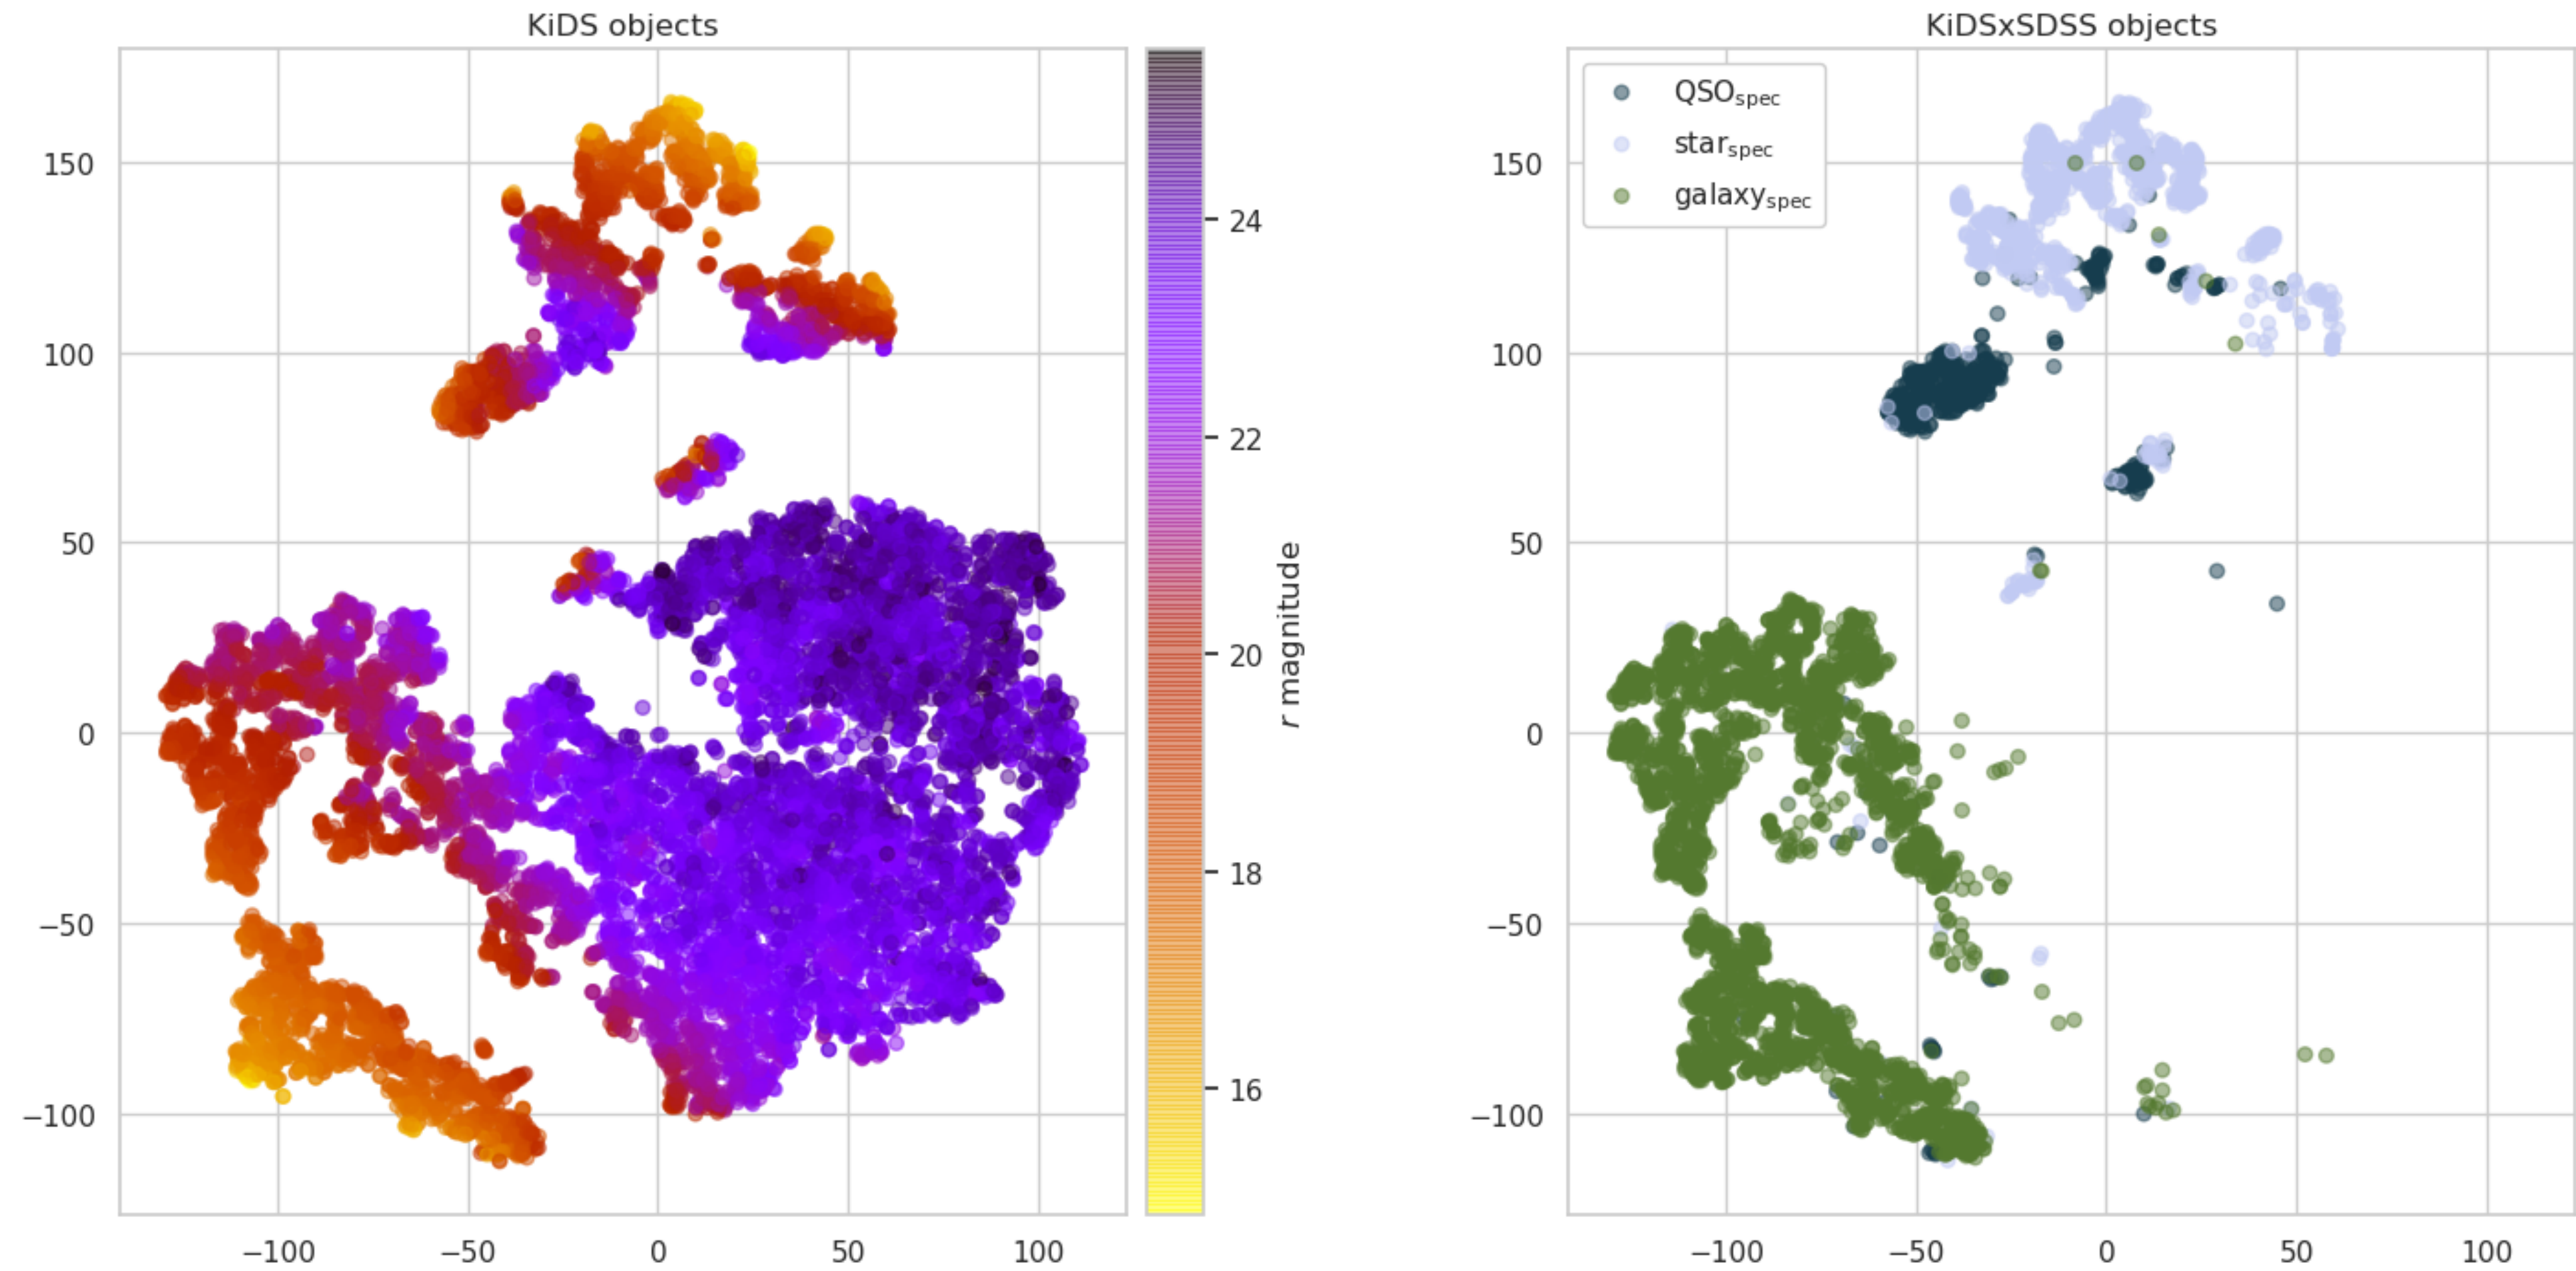

# Methodology

# Data

- Kilo-Degree Survey (KiDS): optical *ugri*
- VISTA Kilo-degree Infrared Galaxy Survey (VIKING): near-infrared *ZYJHKs*
- Depth:  $r < 25$
- Data release 4: 1006 square-degrees (1350 in the final DR5), ~100M objects
- 9 band detections yield 45M objects

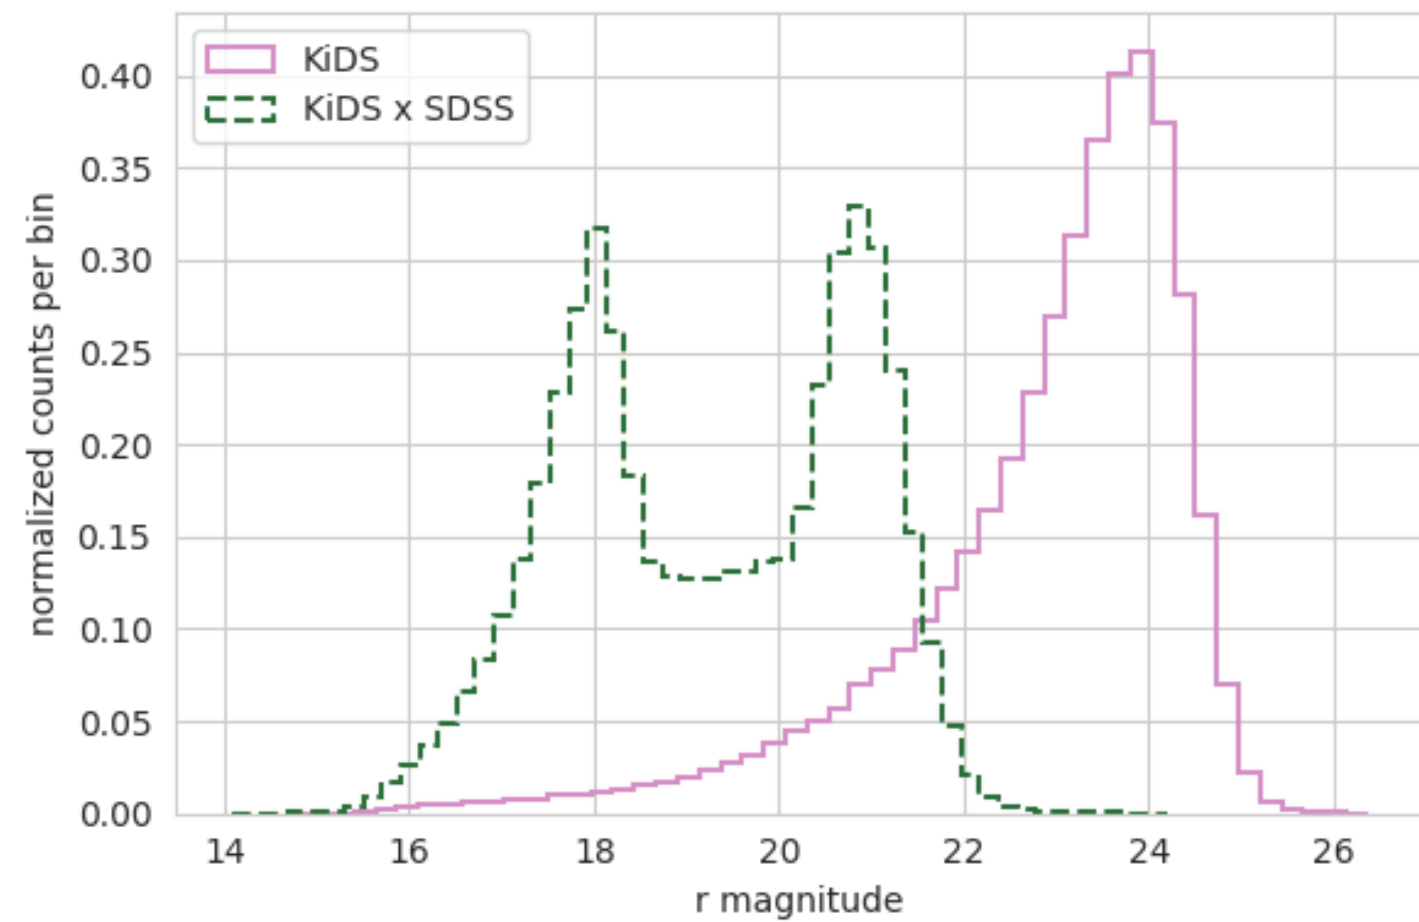

# Extrapolation problem

t-SNE projection of **KiDSxSDSS** data. *Left*:  $r$  magnitude, *right*: SDSS spectroscopic classification.

# Inference subsets

Normalized histograms of the  $r$  magnitude for the KiDS inference data and the KiDS x SDSS training set.

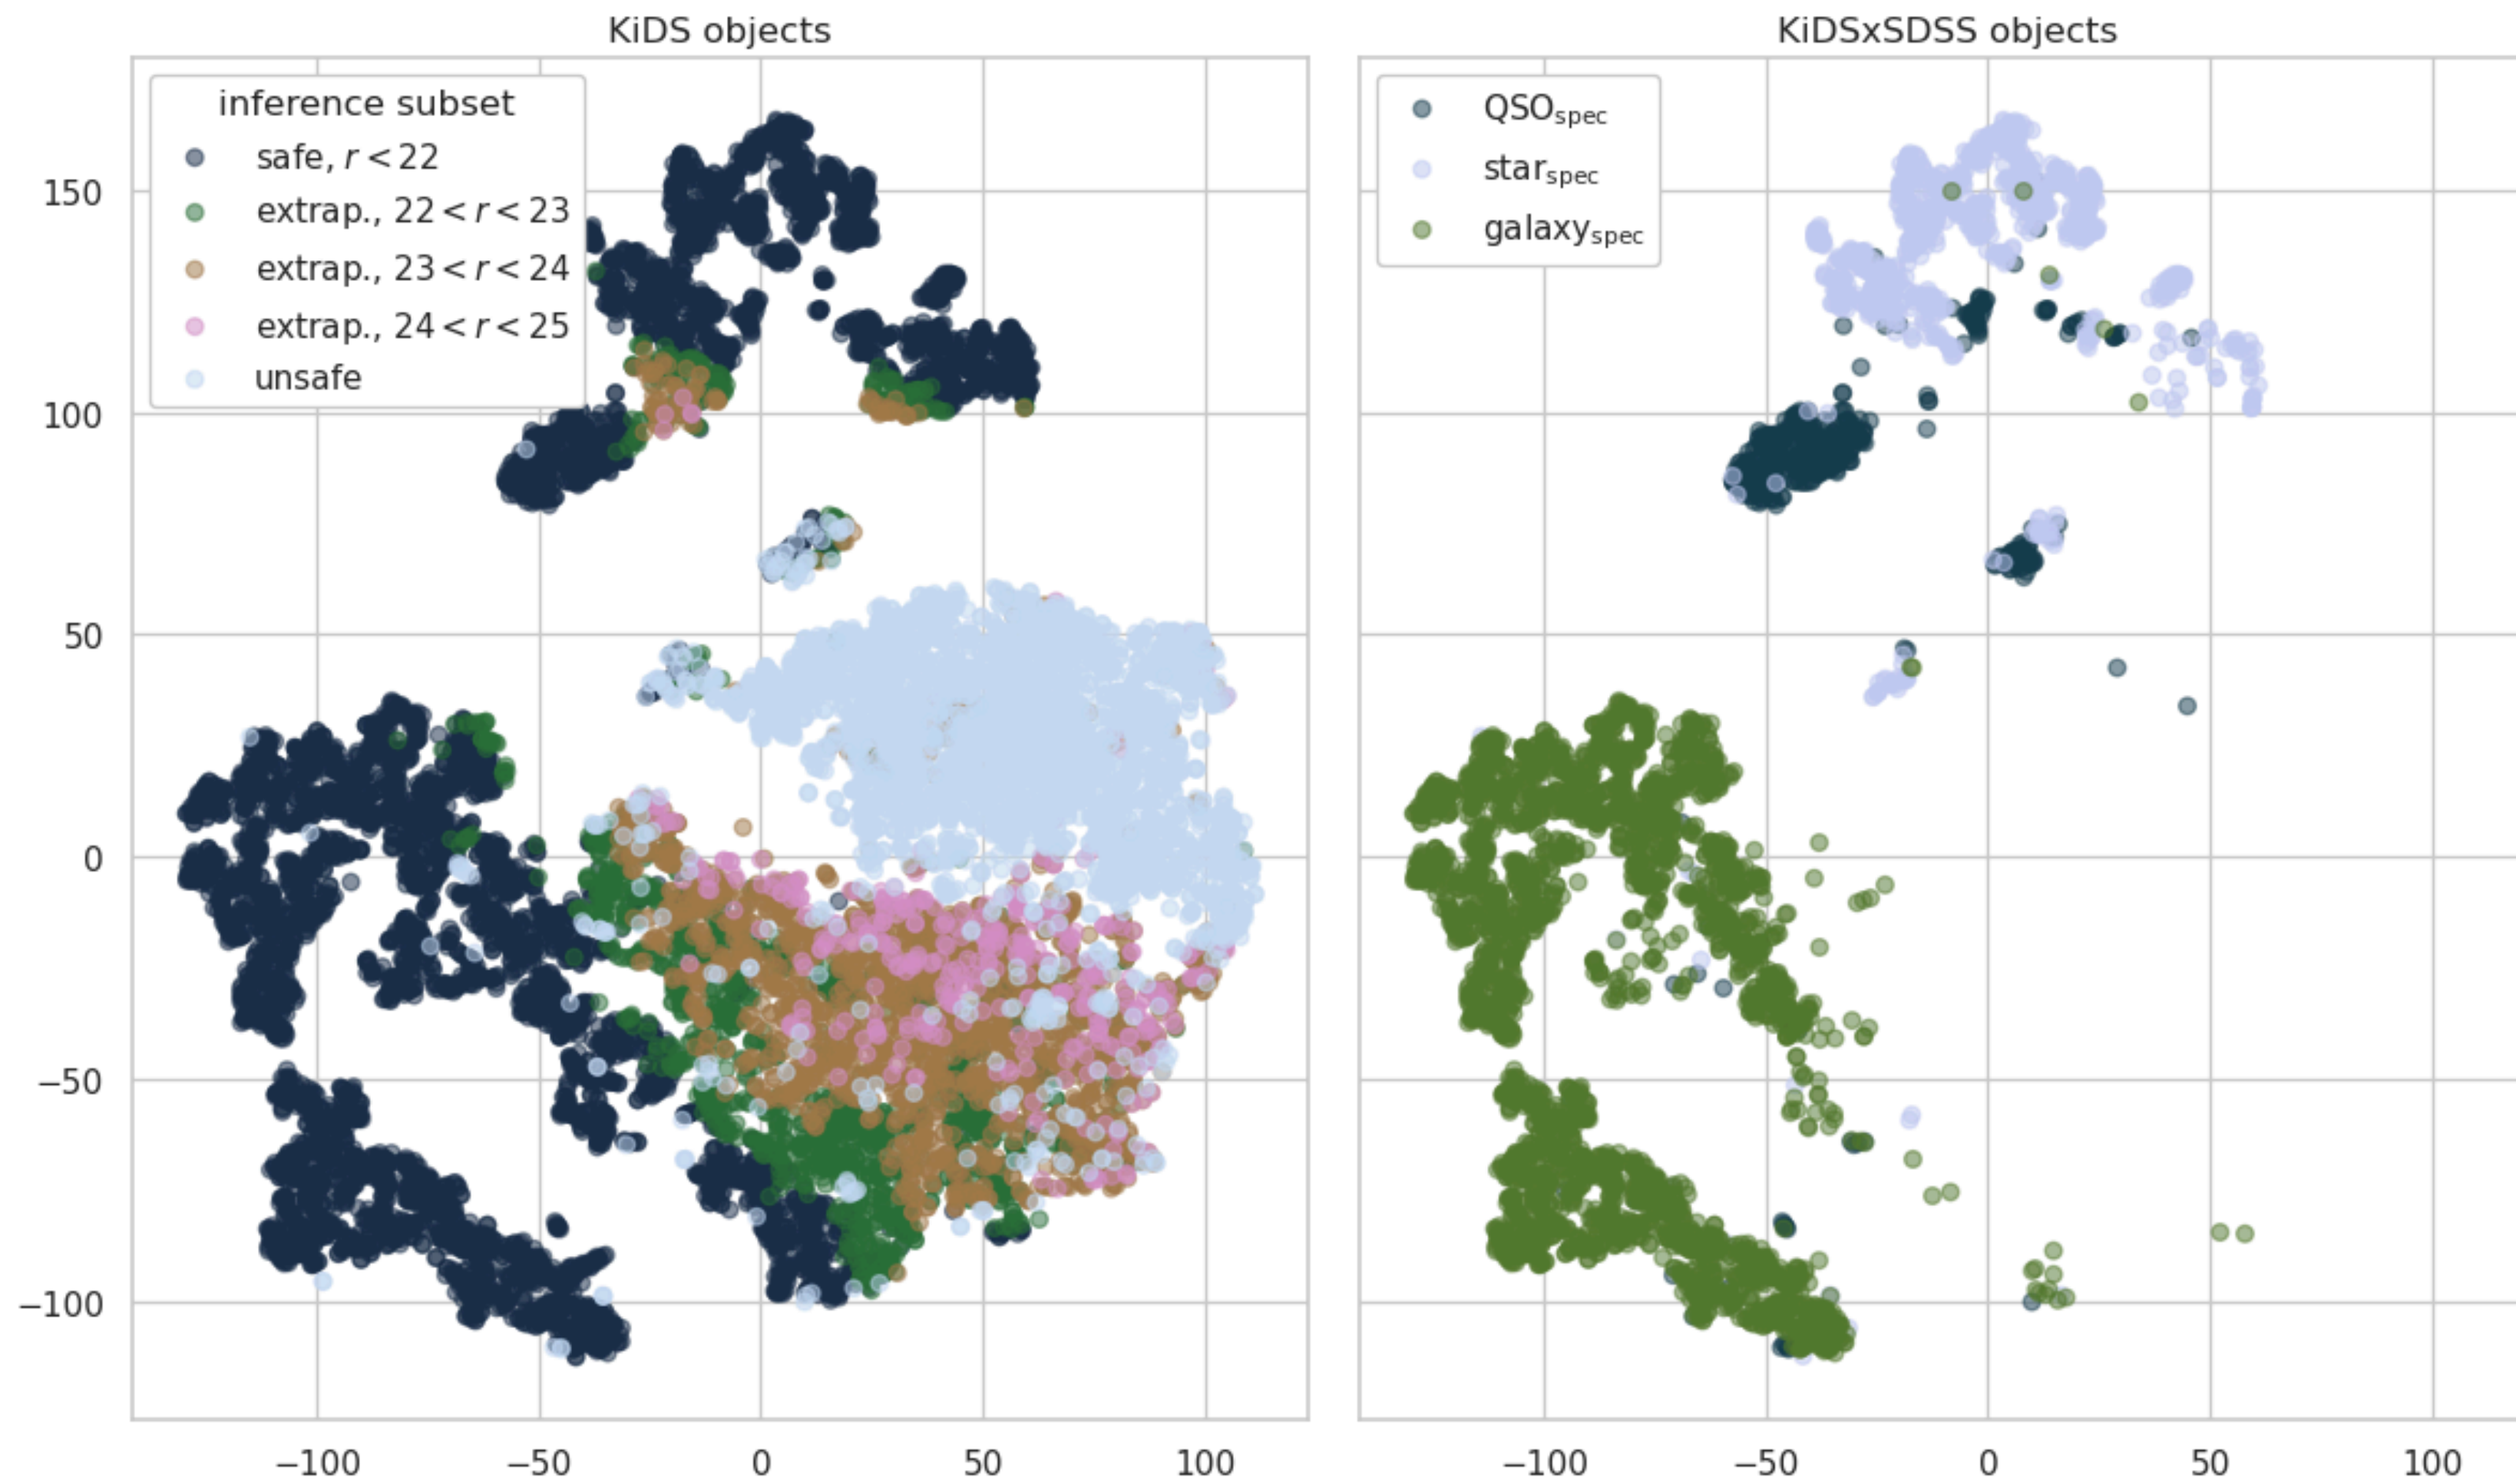

Normalized histograms of Sextractor's stellerity index for training and inference datasets.

Distribution of inference subsets over the  $r$  magnitude.

subset name	$r$ magnitude	stellarity index	size
safe	$r < 22$	not in (0.2, 0.8)	21%
extrapolation	$22 < r < 25$	not in (0.2, 0.8)	45%
unsafe	$r > 25$	in (0.2, 0.8)	34%

# Inference subsets

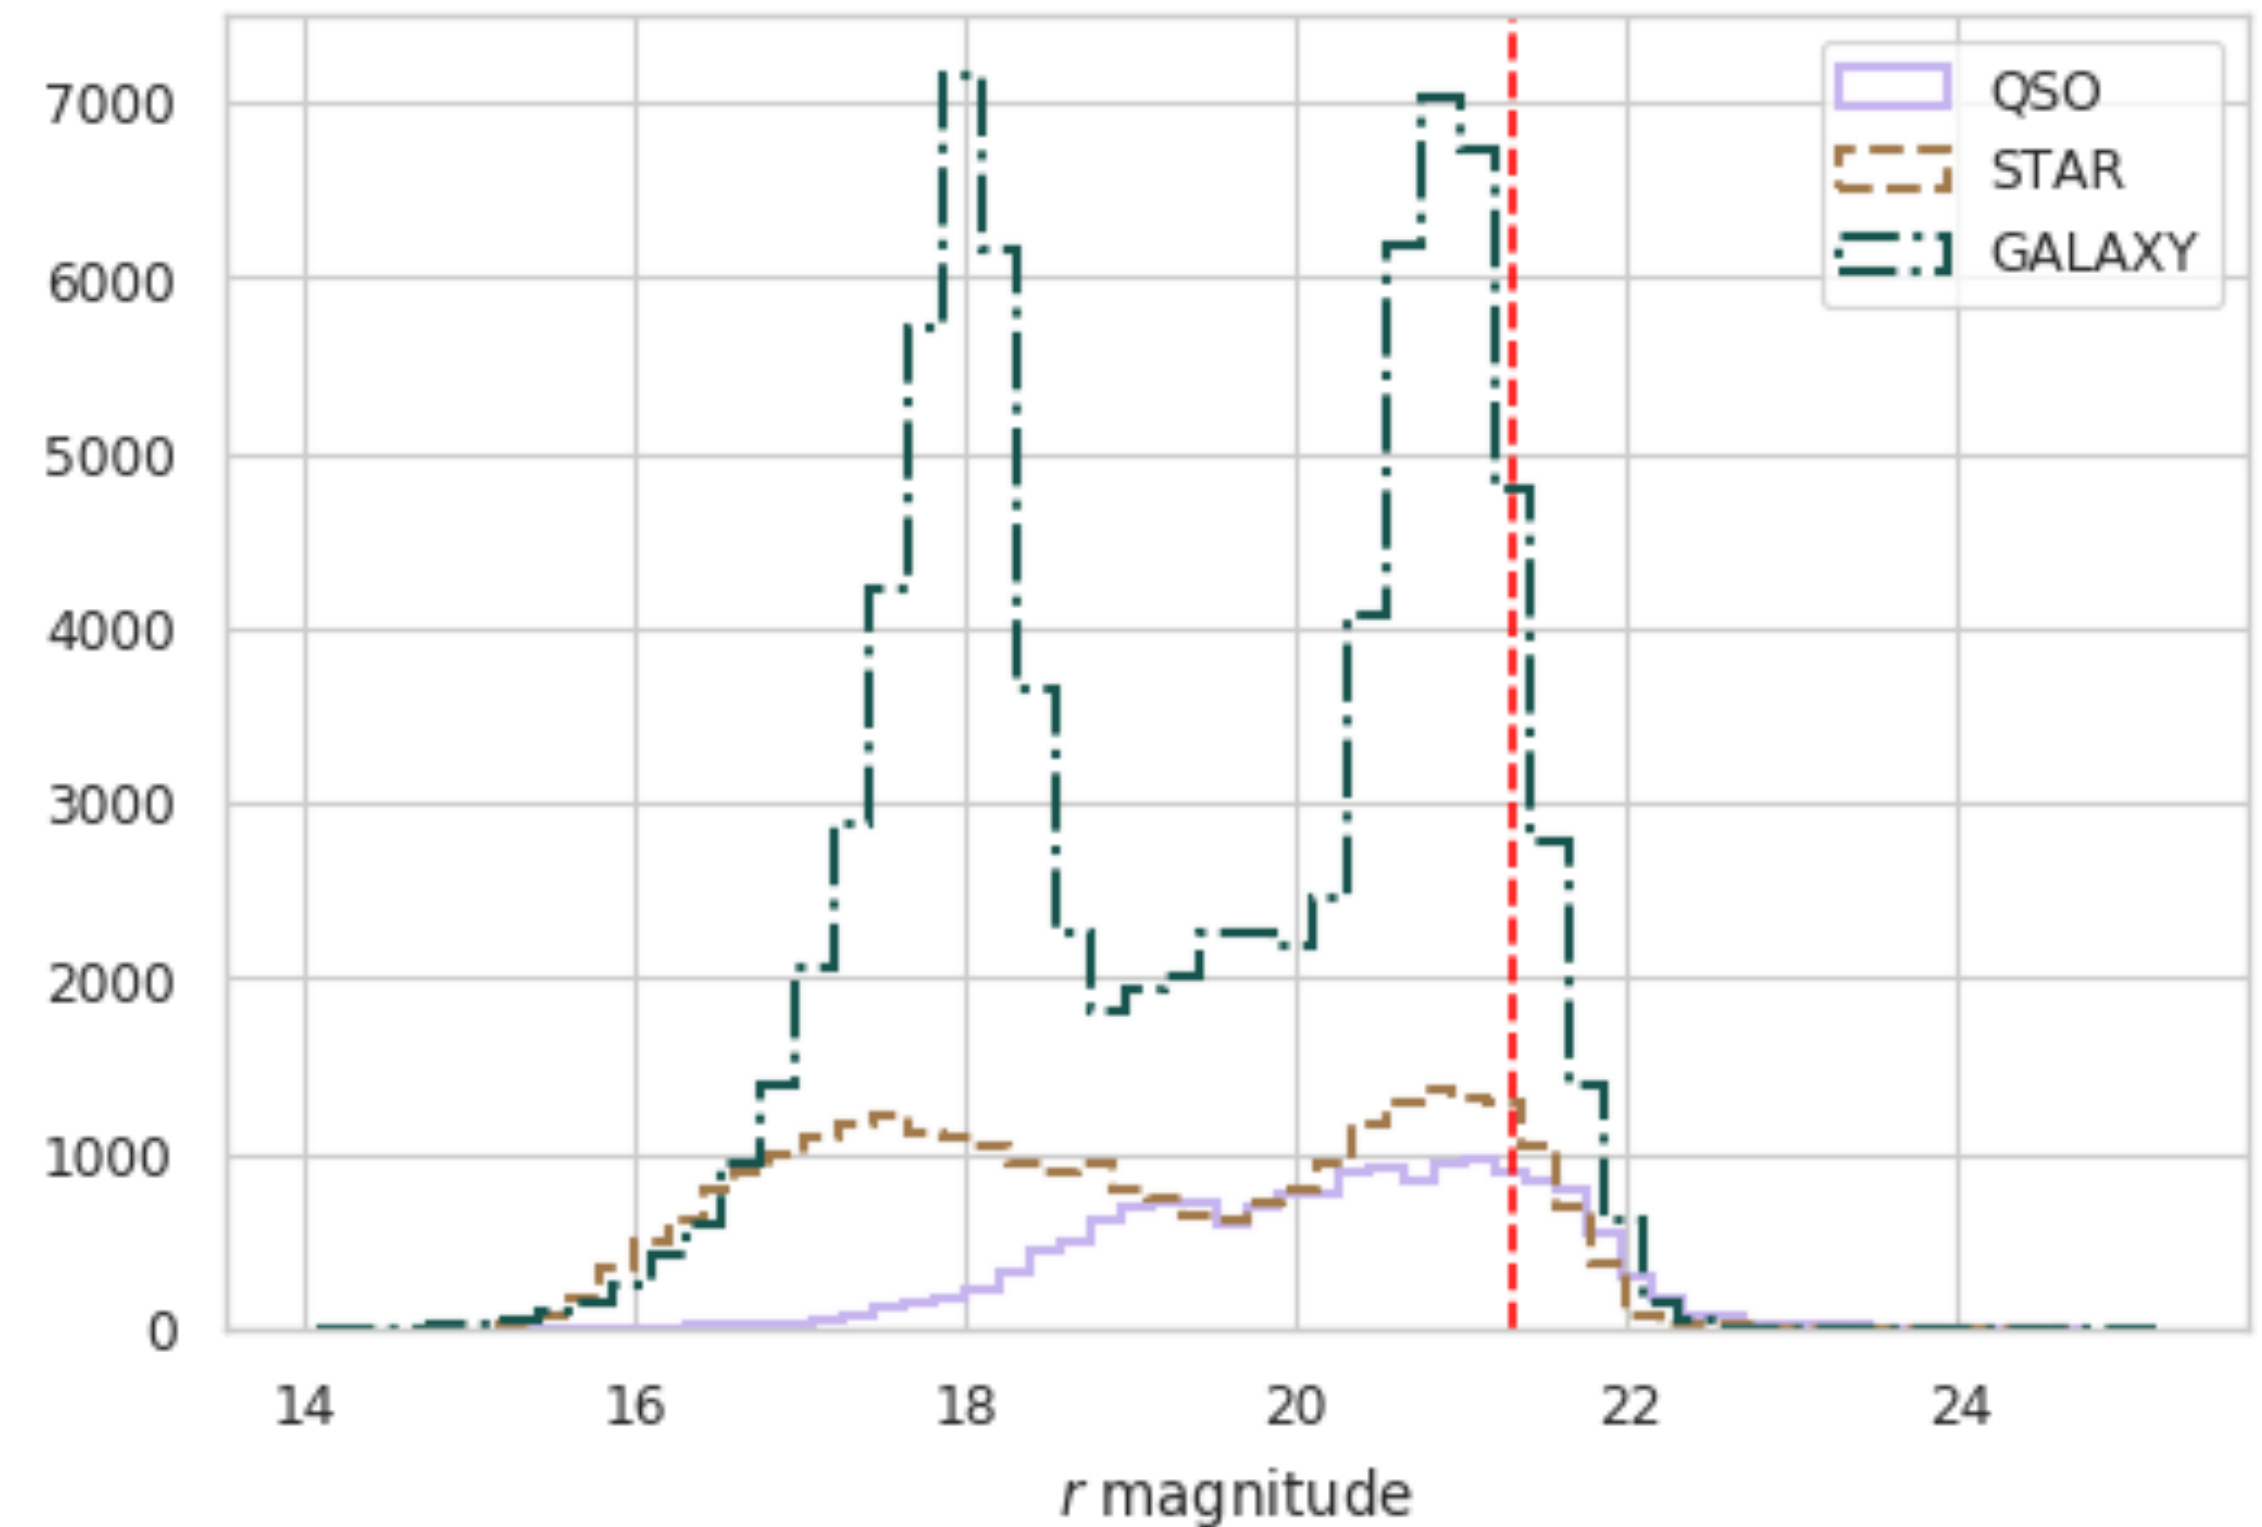

t-SNE projection of KiDSxSDSS data. *Left: inference subsets, right: SDSS spectroscopic classification.*

# Testing

## Using internal data structure

- Model training is based on random test
- Parameters tuning is based on random and faint extrapolation tests
- New models are trained for inference with parameters derived from experiments (except number of epochs/trees)

Distribution of spectroscopic classes in the training dataset. The red dashed line at  $r = 21.3$  separates data used for the faint extrapolation test.

# Experiment results

# Testing

## Method comparison

Learning histories for XGBoost. *Left:* classification, *center:* QSO redshift, *right:* galaxy redshift.

# Model selection

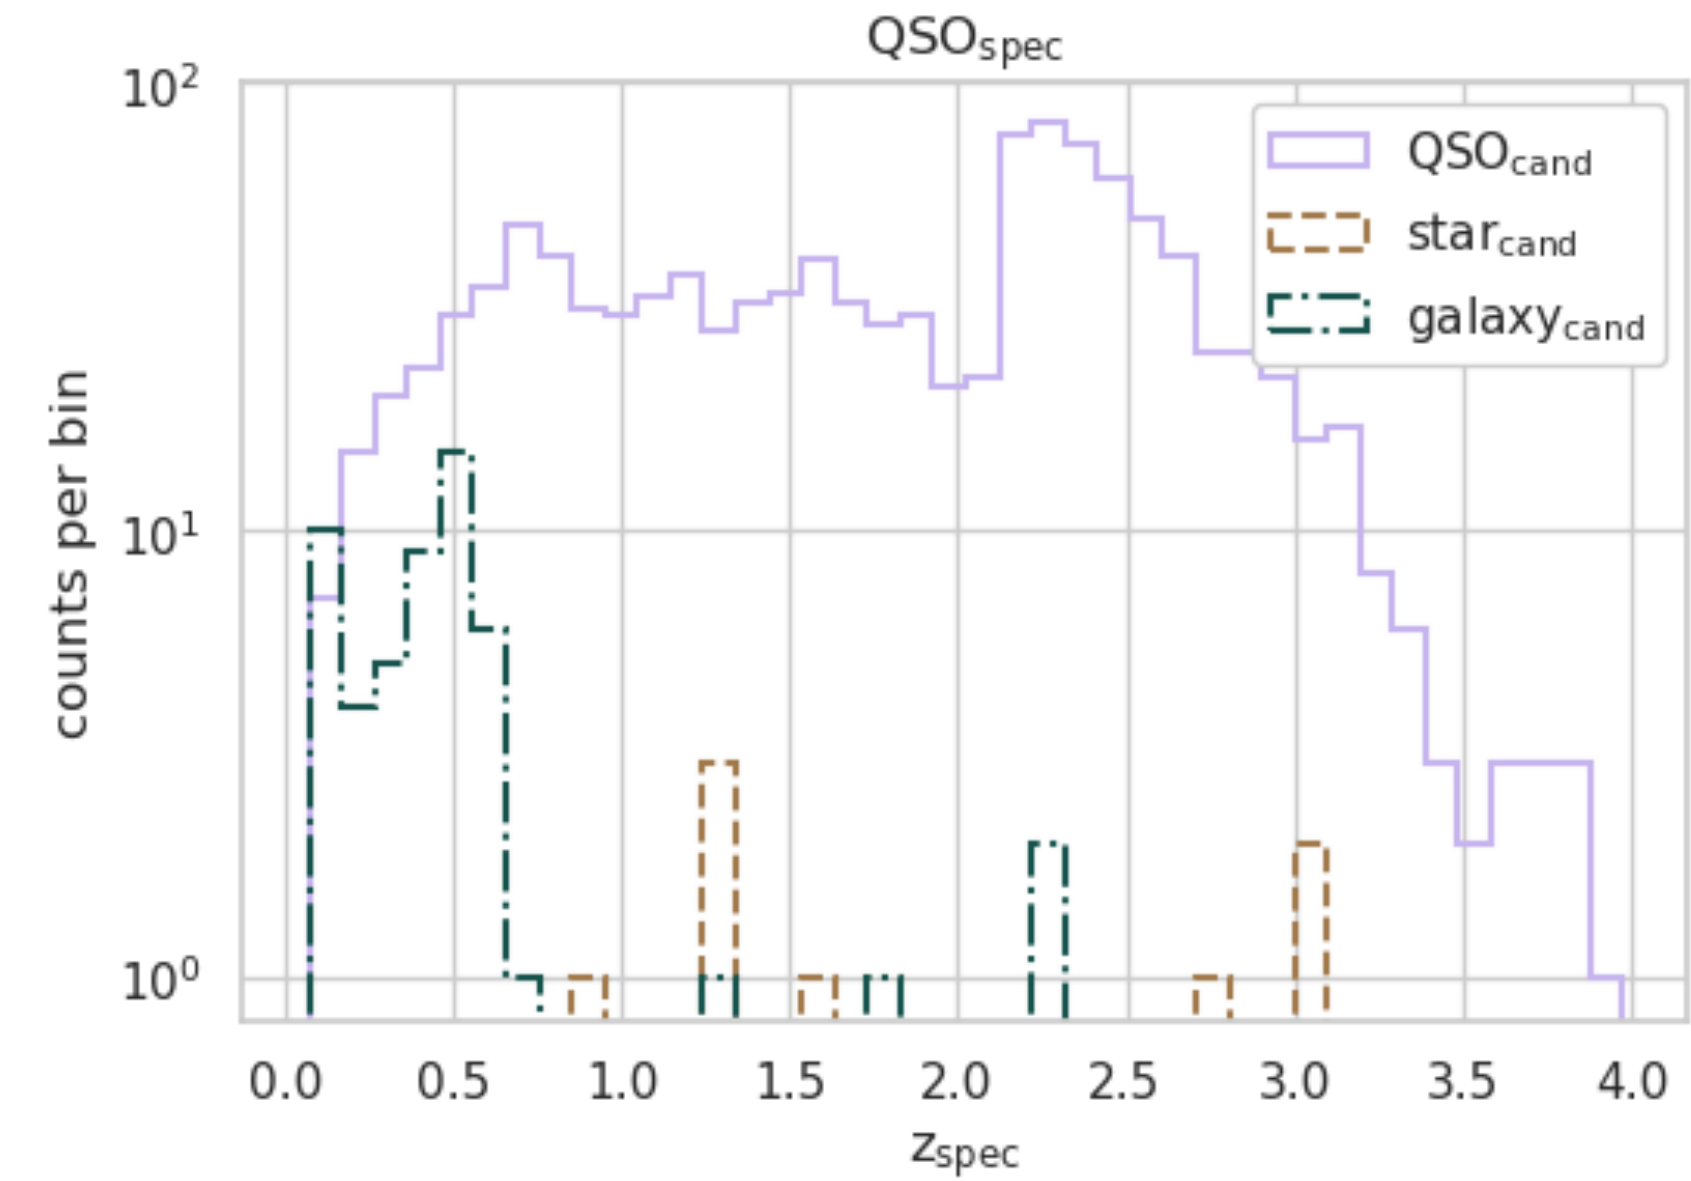

## Experimental comparison

test	model	classification			redshift in $QS O_{spec}$			redshift in $QS O_{photo}$		
		accuracy	purity	recall	MSE	R2	z error	MSE	R2	z error
random	RF	99.00%	97.44%	94.31%	0.12	85%	$0.018 \pm 0.14$	0.12	84%	$0.032 \pm 0.21$
	XGB	<b>99.09%</b>	<b>97.85%</b>	<b>94.75%</b>	0.13	84%	$0.017 \pm 0.15$	0.13	83%	$0.030 \pm 0.21$
	ANN	98.98%	96.93%	94.67%	<b>0.10</b>	<b>88%</b>	<b><math>0.009 \pm 0.12</math></b>	0.11	85%	$0.023 \pm 0.22$
	<b>clf XGB, z ANN</b>	<b>99.09%</b>	<b>97.85%</b>	<b>94.75%</b>	<b>0.10</b>	<b>88%</b>	<b><math>0.009 \pm 0.12</math></b>	<b>0.10</b>	<b>87%</b>	<b><math>0.020 \pm 0.19</math></b>
faint extrap.	RF	<b>97.44%</b>	96.12%	<b>92.37%</b>	0.31	31%	$0.019 \pm 0.25$	0.33	31%	$0.046 \pm 0.38$
	XGB	<b>97.44%</b>	96.48%	92.12%	0.27	39%	$0.036 \pm 0.23$	0.34	29%	$0.077 \pm 0.41$
	ANN	97.27%	<b>96.52%</b>	90.89%	<b>0.22</b>	<b>51%</b>	<b><math>-0.0004 \pm 0.19</math></b>	<b>0.28</b>	<b>39%</b>	<b><math>0.042 \pm 0.37</math></b>
	<b>clf XGB, z ANN</b>	<b>97.44%</b>	96.48%	92.12%	<b>0.22</b>	<b>51%</b>	<b><math>-0.0004 \pm 0.19</math></b>	0.31	35%	$0.050 \pm 0.40$

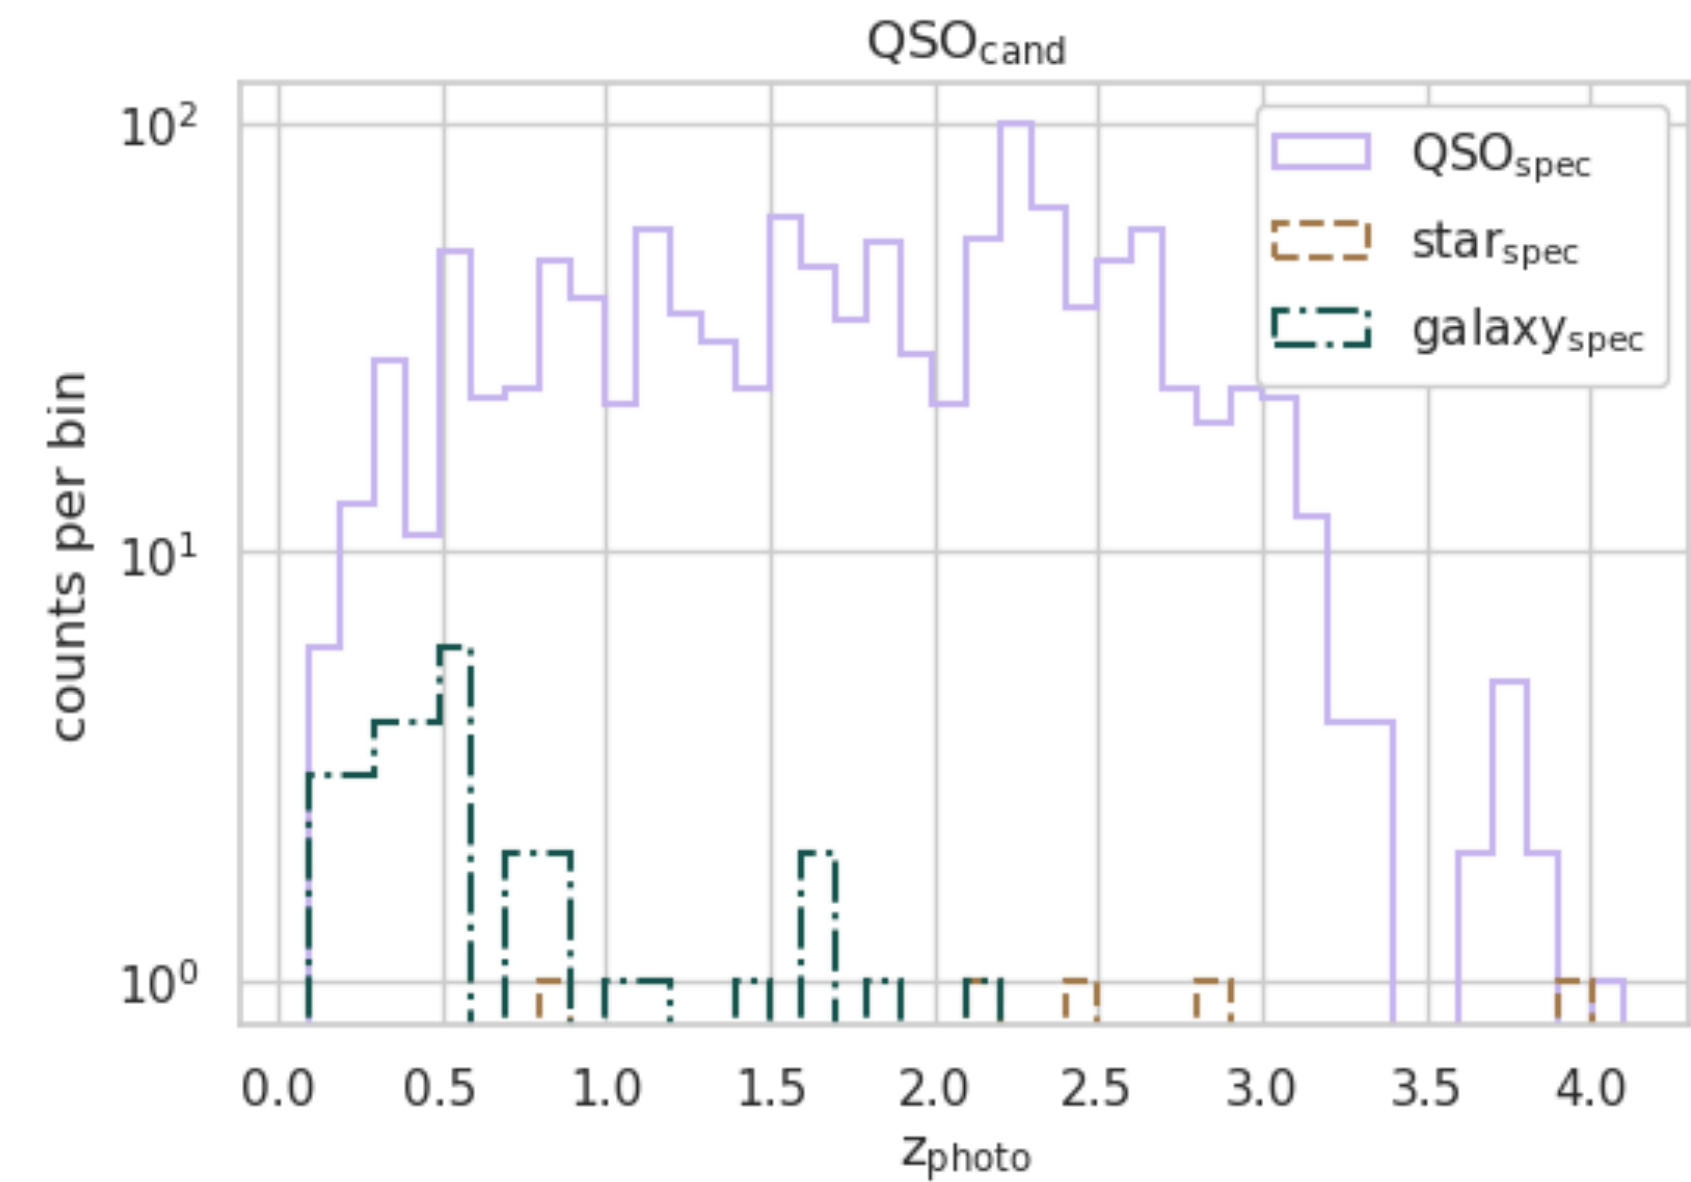

**Final method:** classification network  
+ QSO redshift network with Gaussian uncertainty

# QSO classification

	3-class accuracy	purity	completeness
randomly selected ( $r < 21.3$ )	99.0%	96.9%	94.7%
faint extrapolation ( $21.3 < r < 22$ )	97.3%	96.5%	90.9%

Completeness test

Purity test

# QSO photo-zs

	$\delta z = \frac{(z_{photo} - z_{spec})}{(1 + z_{spec})}$
<b>randomly selected (<math>r &lt; 21.3</math>)</b>	0.009 +/- 0.12
<b>faint extrapolation (<math>21.3 &lt; r &lt; 22</math>)</b>	-0.0004 +/- 0.19

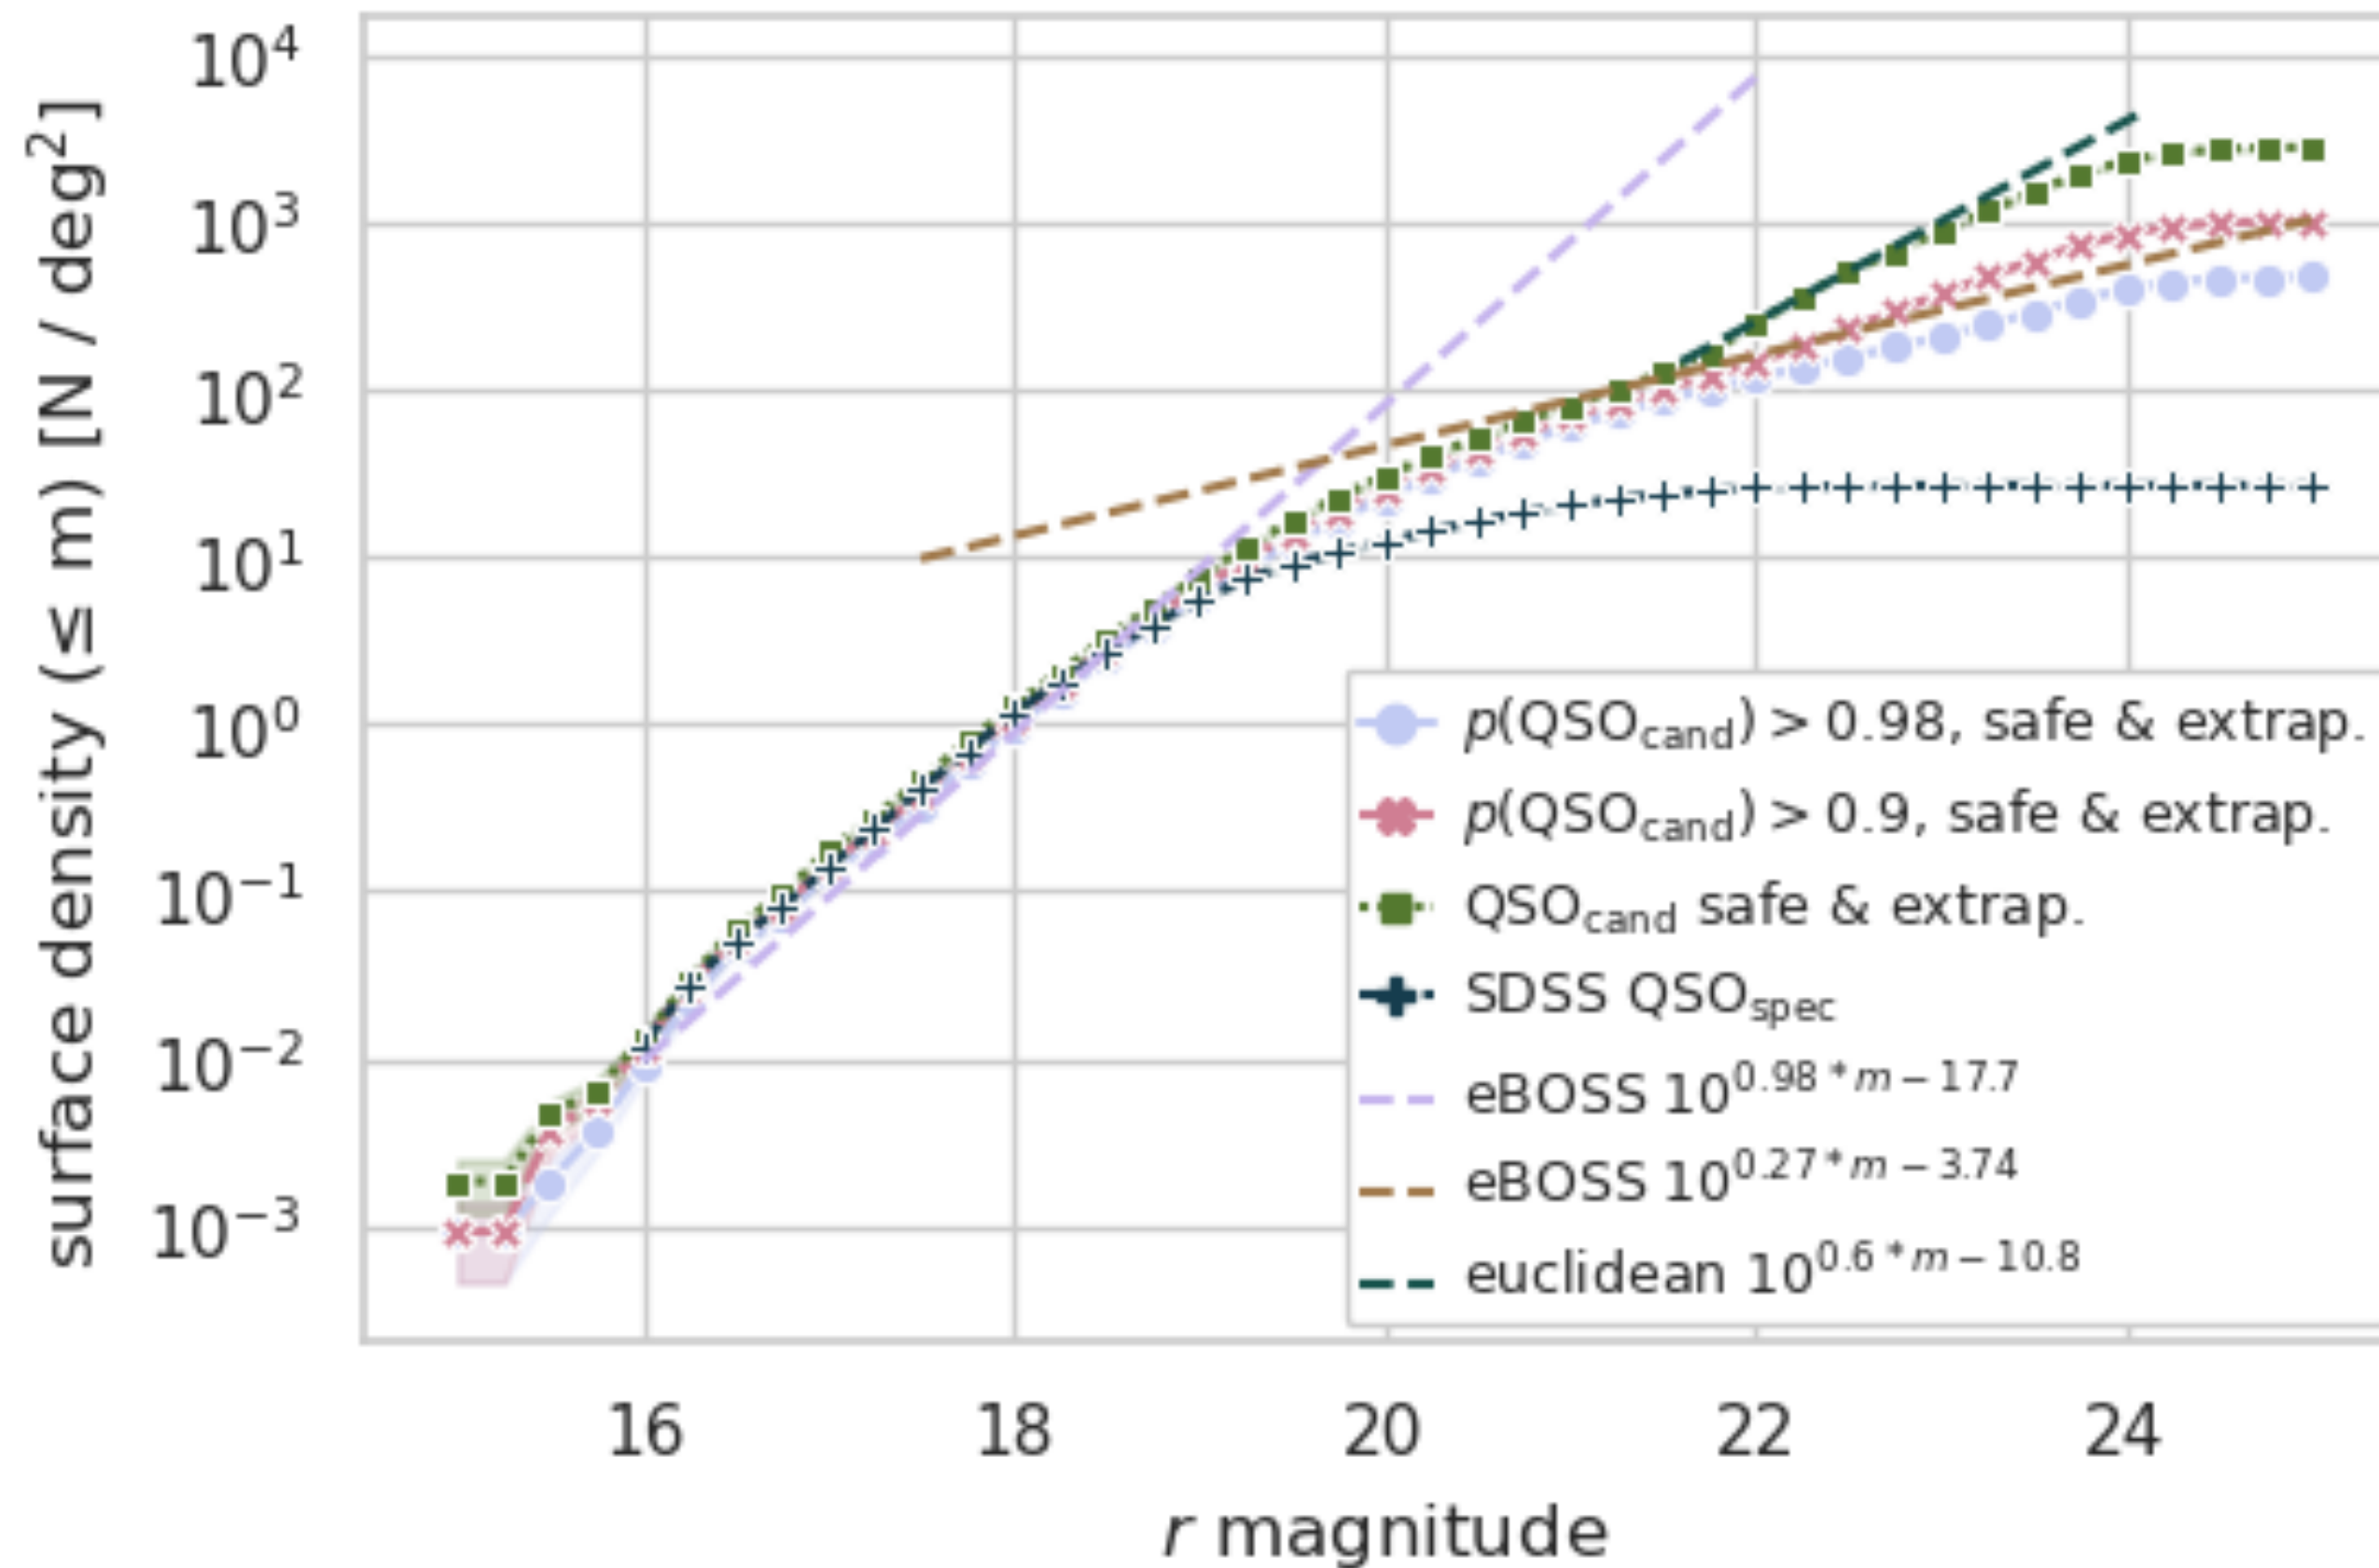

Comparison of the spectroscopic and photometric redshifts on SDSS quasars. *Left:* random test ( $r < 21.3$ ), *right:* faint extrapolation test ( $21.3 < r < 22$ )

**Final catalog properties**

# Number counts

## Completeness of the catalog

- Straight dashed lines: quasar model from eBOSS
- Expected number counts at  $p(\text{QSO}_{\text{cand}}) > 0.98$
- Limited by the extrapolation subset which stops growing at  $r > 23.5$

KiDS photometric QSO catalog at progressing probability cuts

# Spatial number density

## Redshift reliability

- Good result at the SDSS completeness limit  $r < 19$
- Expected peak at  $z > 2$  for  $p(\text{QSO}_{\text{cand}}) > 0.98$  and  $r < 23.5$
- Contamination with low- $z$  galaxies at  $r > 23.5$

Spatial number density for KiDS photometric QSO at progressing magnitudes and corresponding probability cuts.

# Parallax test

## Purity of the catalog

Mean parallax value for photometric quasars as a function of minimum classification probability.

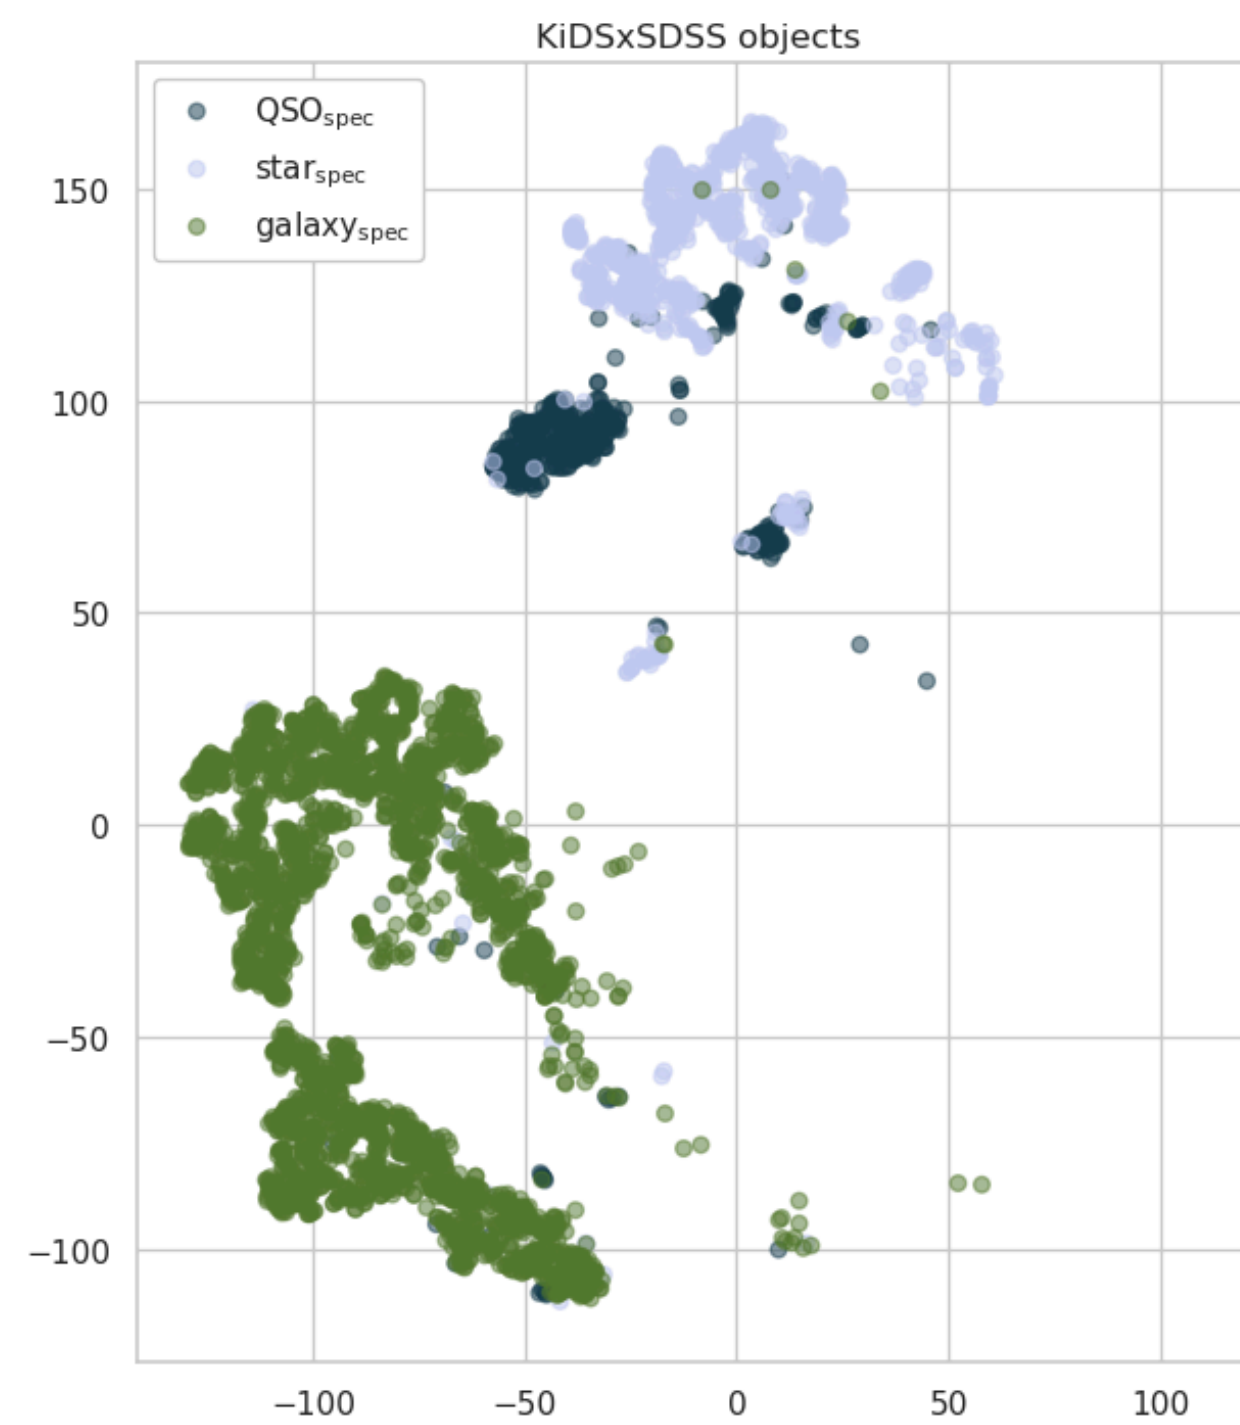

# The final catalog

## Suggested probability cuts

	safe $r < 22$	safe & extrap. $r < 23.5$	safe & extrap. $r < 25$
QSO <sub>cand</sub>	266k (100%)	1.6M (100%)	3M (100%)
$p(\text{QSO}_{\text{cand}}) > 0.90$	<b>158k (59%)</b>	637k (39%)	1.1M (36%)
$p(\text{QSO}_{\text{cand}}) > 0.98$	127k (48%)	<b>311k (19%)</b>	507k (17%)

Suggested probability cuts at progressing magnitudes

# Classification Visualisation

t-SNE projection of KiDS + KiDSxSDSS data. *Left*: photometric classification, *center*: SDSS spectroscopic classification, *right*: final photometric QSO catalog.

# Applications

Catalog ready for:

- tomographic study of LSS
- AGN studies (e.g. SED fitting, possible test on photo-zs)

# Main takeaways

Key points to successful ML application:

1. Data research and visualisations  
t-SNE visualisations, feature understanding, inference subsets
2. Tough model validation method  
Faint extrapolation test to fit bias vs variance trade-off
3. Physically-driven testing approach  
Number counts and GAIA parallaxes to fit purity vs completeness

**Thank you!**
