Background

Research positions

Institut d'Astrophysique de Paris

Postdoc

France
2021–Present

Johns Hopkins University, Baltimore

Visiting Researcher, with Prof. Emanuele Berti,

USA
October–November 2019

IPMU, Tokyo

Visiting Researcher, with Prof. Sugiyama,

Japan
March 2018

Institut d'Astrophysique de Paris

PhD student at Sorbonne Université,

France
2017–2020

Education

○ **Institut d'Astrophysique de Paris**

PhD in Astrophysics (The cusp-core problem in dwarf galaxies: New solutions),

Sorbonne Université

Doctoral Advisors: Dr Roya Mohayaee and Prof. Joseph Silk,

France
2017–2020

○ **Ecole Normale Supérieure de Lyon (ENS)**

MSc "Physique, concepts et applications",

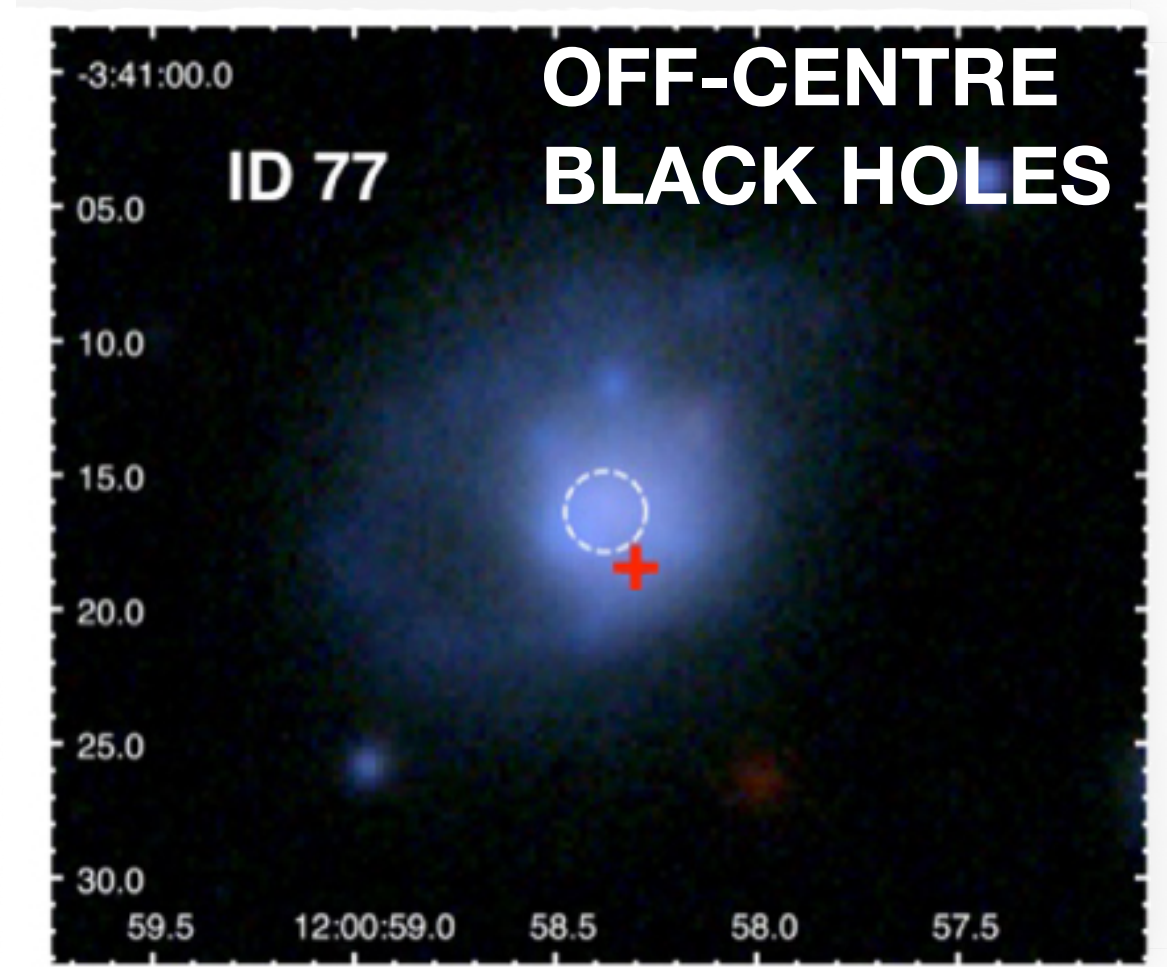

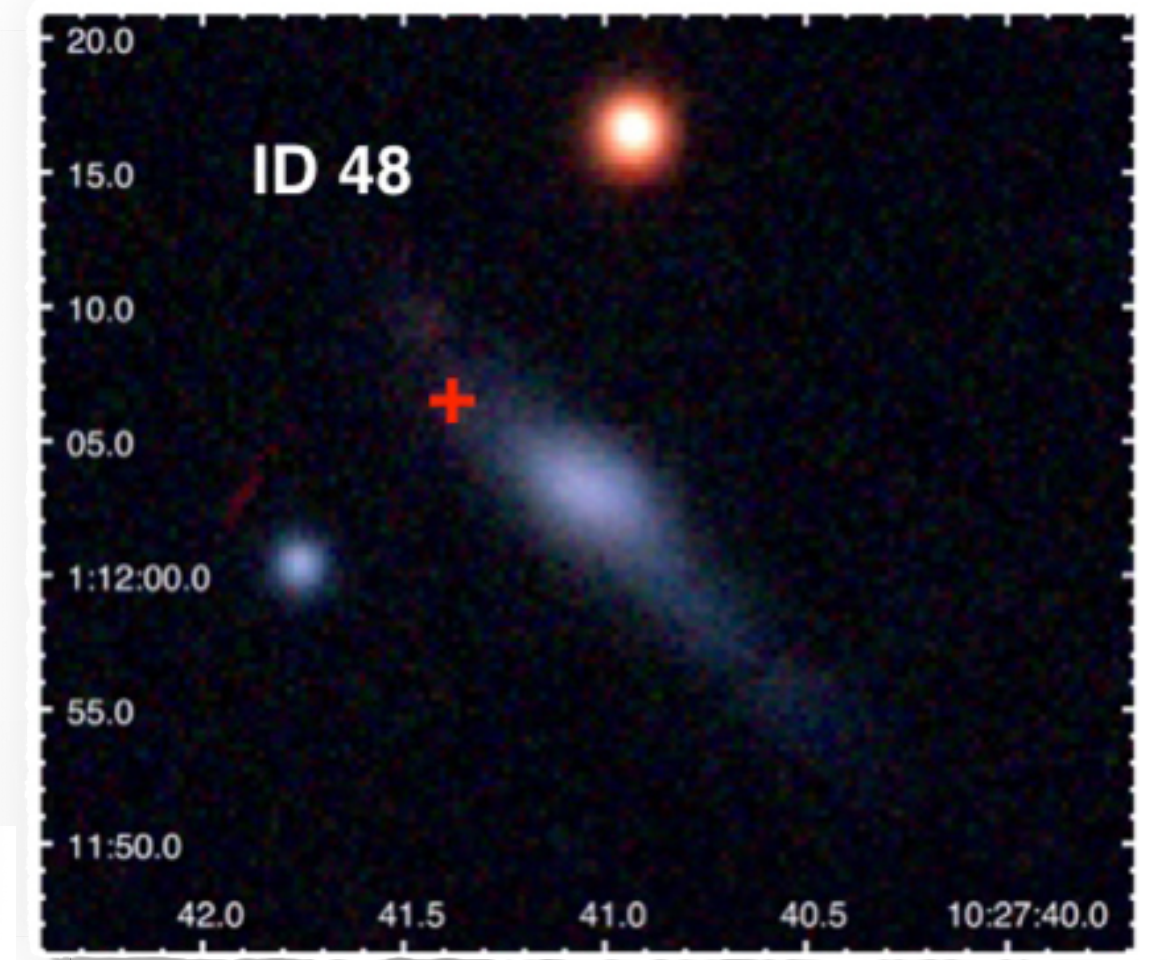

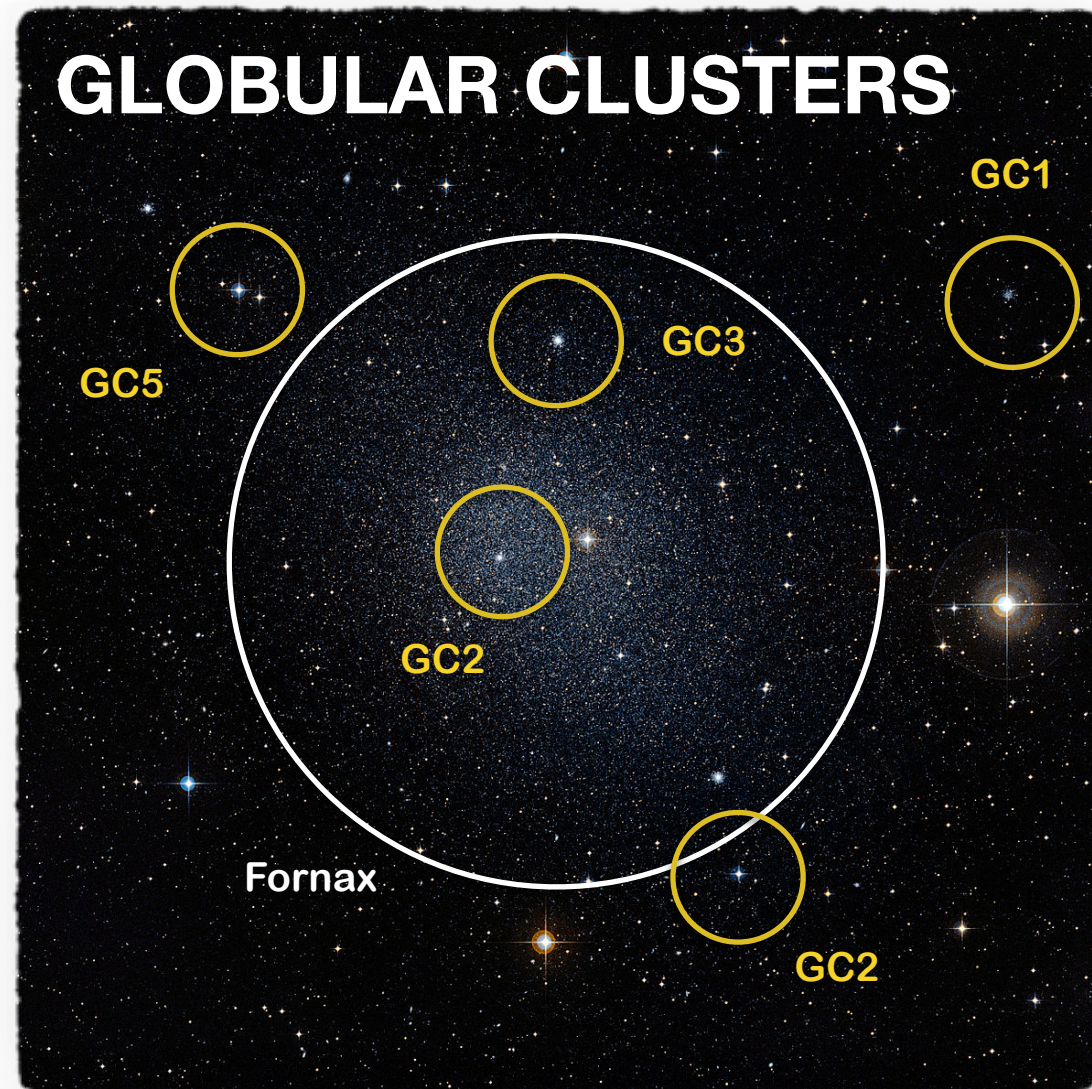

France
2014–2017

About me

I'm currently postdoc at the [Institut d'Astrophysique de Paris \(IAP\)](#). I use computational methods to study the evolution and dynamics of galaxies in order to reproduce observational data highlighted by the [Gaia mission](#).

My doctoral research at IAP focused on the nature of the dark matter and more particularly on the inconsistency of inner DM density profiles in dwarf galaxies, known as the [cusp-core problem](#). I perform simulations with the high performance collisionless N-body code, [Gothic](#). This gravitational octree code runs entirely on GPU with adaptive time steps. My high resolution approach is the pathway to high resolution that is far beyond that of any cosmological simulation.

My work on globular clusters will be also pursued in the context of the [Laser Interferometer Space Antenna \(LISA\)](#) mission. Since January 2019, I am involved in a LISA working group with the primary motivation to explore the existence of intermediate massive black holes in globular clusters.
