

# Direct Identifications of Recent Core-Collapse SN Progenitors

Schuyler Van Dyk (SSC/Caltech)

---

Main co-conspirators:

Nancy Elias-Rosa (SSC/Caltech)

Weidong Li (UC Berkeley)

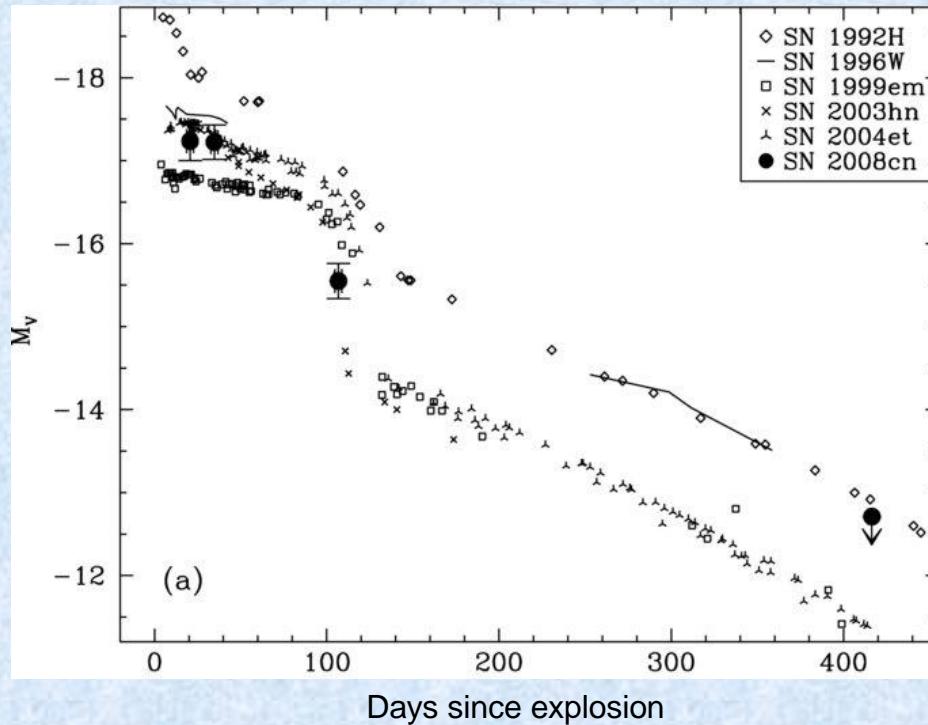

Alex Filippenko (UC Berkeley)

# Outline of talk

- SN 2008cn in NGC 4603
- SN 2009kr in NGC 1832
- SN 2009hd in M66 (NGC 3627)
- SN 2008bk in NGC 7793

# The high-luminosity SN II-P 2008cn in NGC 4603

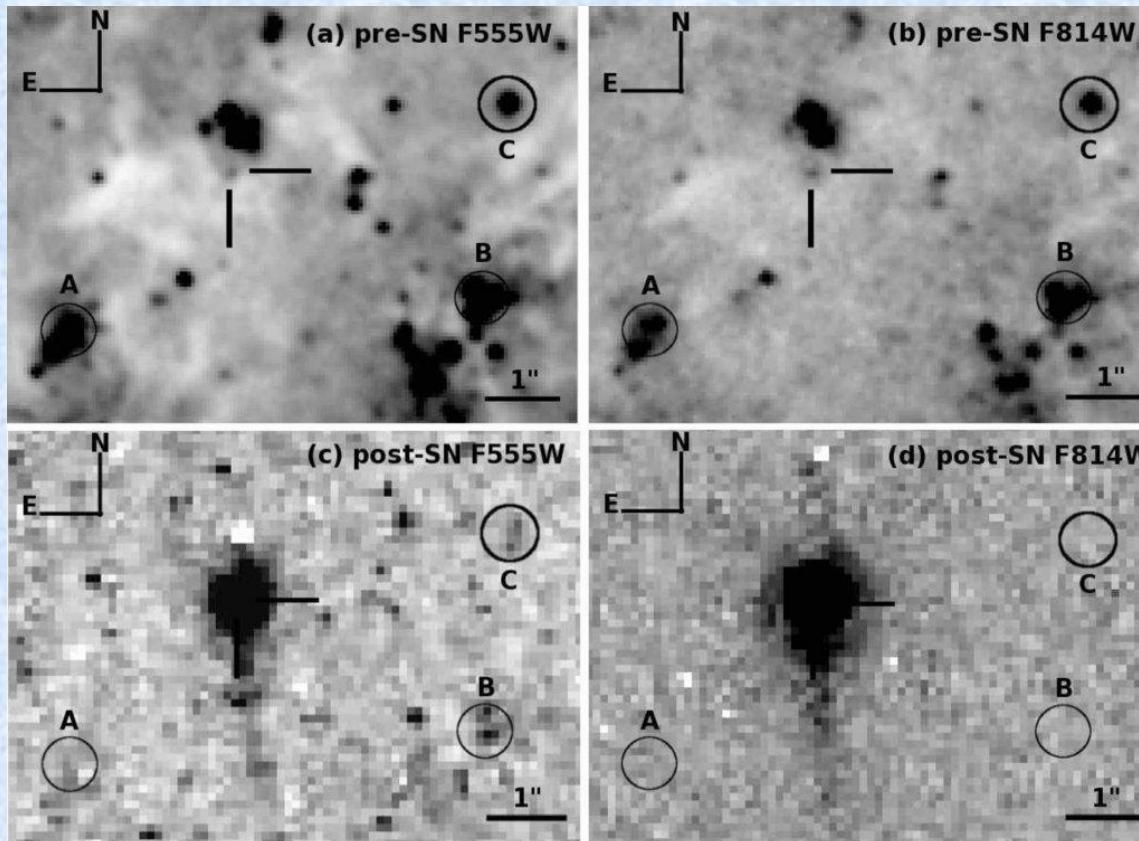

- $M_V = -17.2$  (more luminous than 99em, less luminous than 92H)

- Spectrum (CSP) most resembles the high-luminosity 96W  
(Elias-Rosa et al. 2009 --- with N. Morrell, S. Gonzales, M. Hamuy,  
J.-C. Cuillandre, R.J. Foley, N. Smith)

# The high-luminosity SN II-P 2008cn in NGC 4603

- Progenitor identified using pre-/post-SN HST WFPC2 imaging

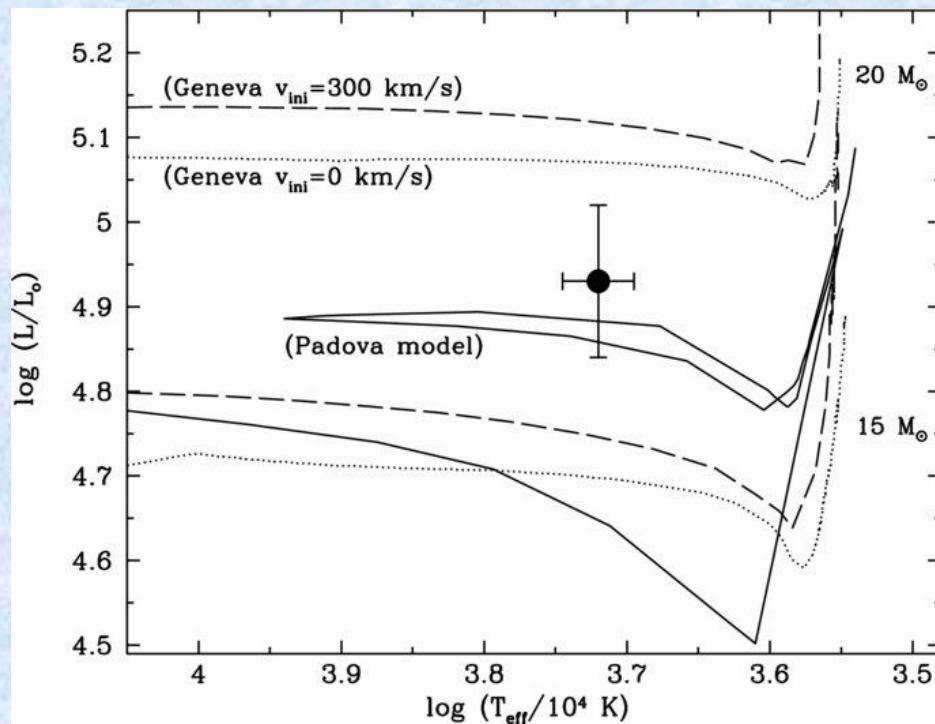

$A_V = 1.08$  mag  
(from Na I D)

Distance=33.3 Mpc  
(from Cepheids)

# The high-luminosity SN II-P 2008cn in NGC 4603

- Progenitor initial mass:  $M_{\text{ini}} \approx 17 \pm 2 M_{\odot}$

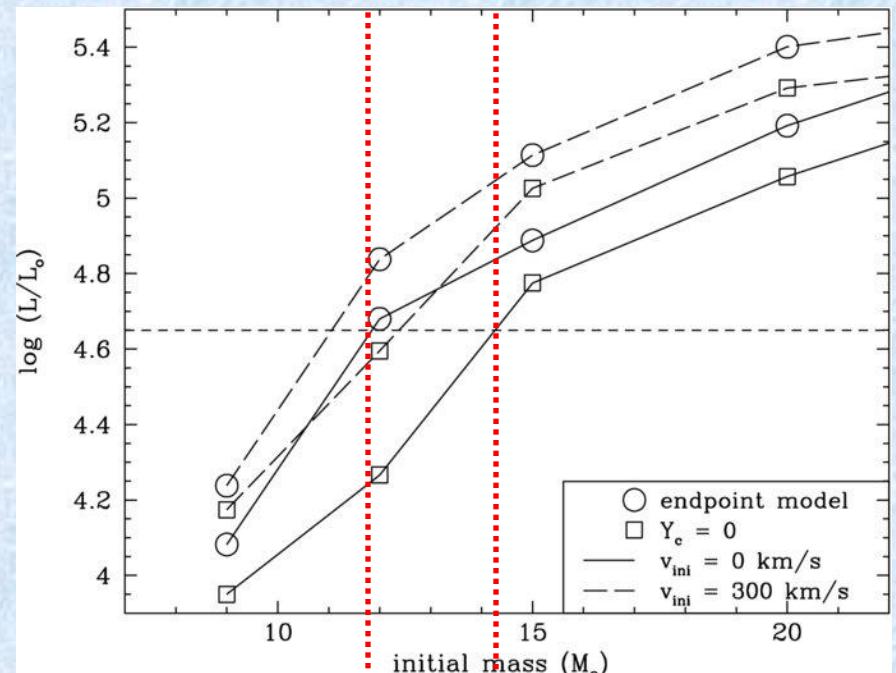

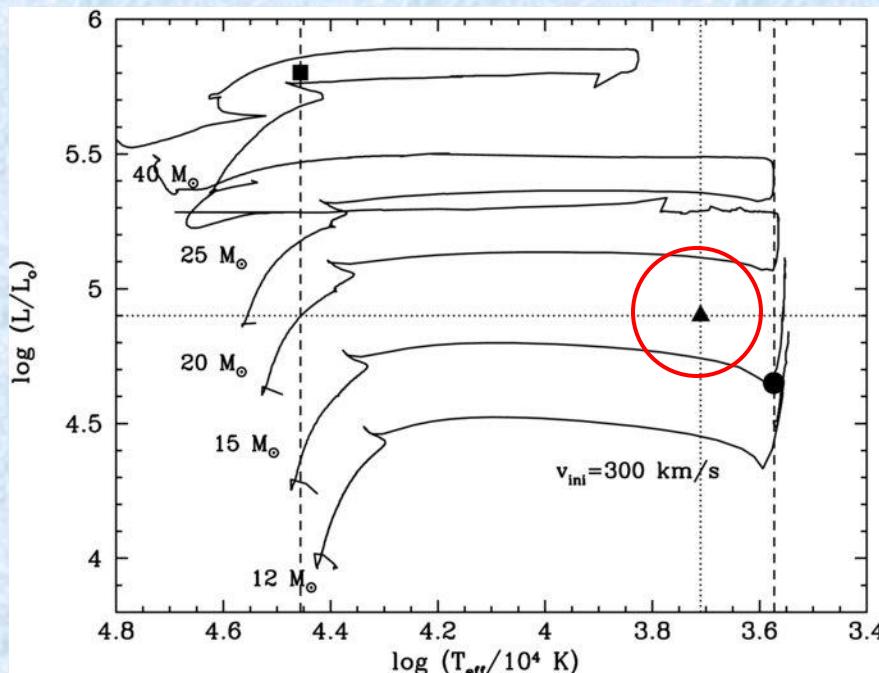

Single yellow supergiant?

Yellow supergiant binary?  
(Ho IX ecl. binary, SMC R47;  
Prieto et al. 2008)

(Elias-Rosa et al. 2009)

# The high-luminosity SN II-P 2008cn in NGC 4603

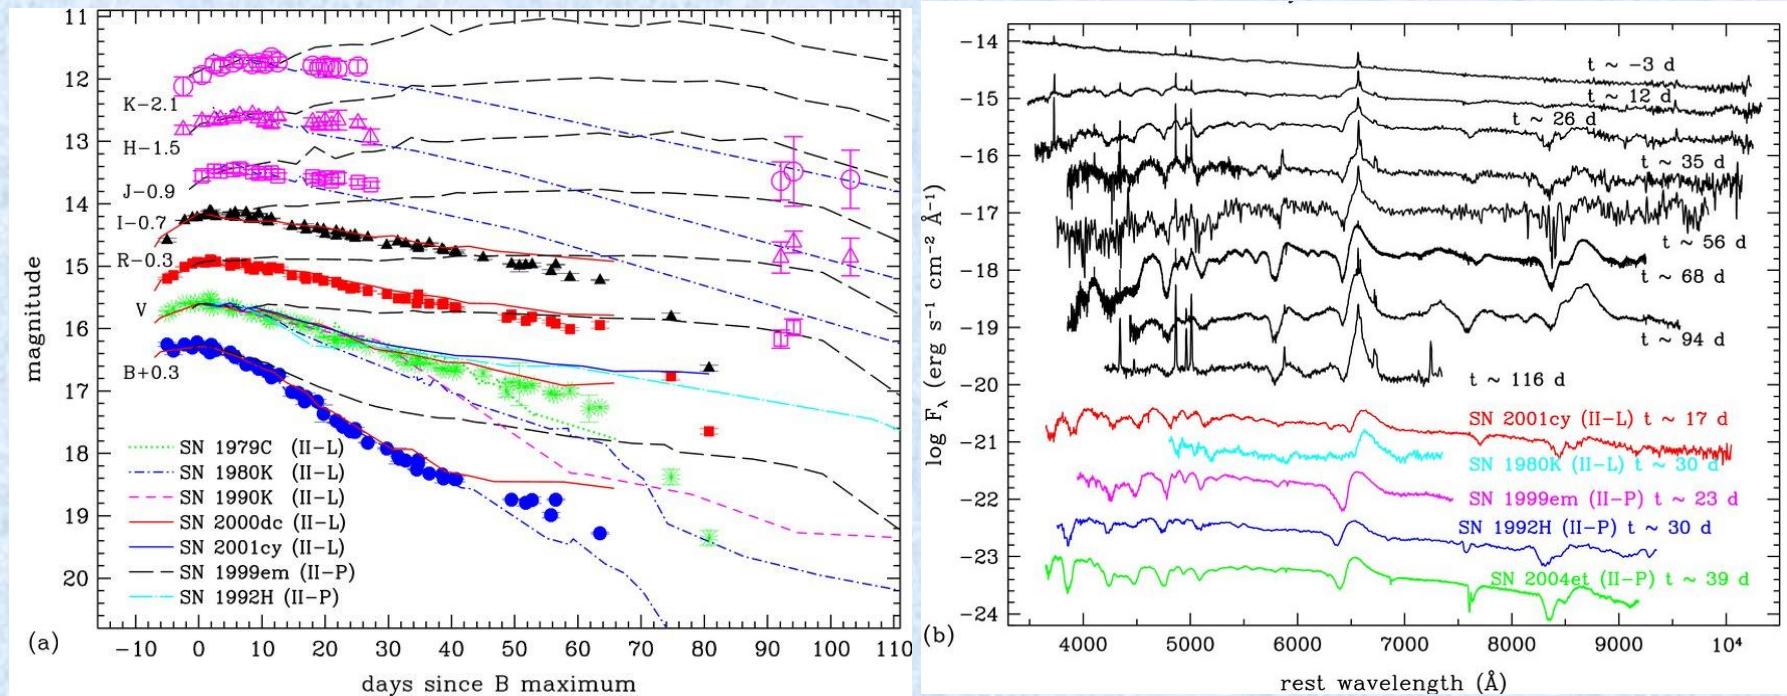

- Alternatives: (a) blend of  $\approx 12 M_{\odot}$  RSG +  $\approx 40 M_{\odot}$  BSG  
 (b) Non-detection limit -- @ end of He burning,  $< 14 M_{\odot}$   
 @ core collapse,  $< 12 M_{\odot}$

(Elias-Rosa et al. 2009)

# The SN II-L 2009kr in NGC 1832

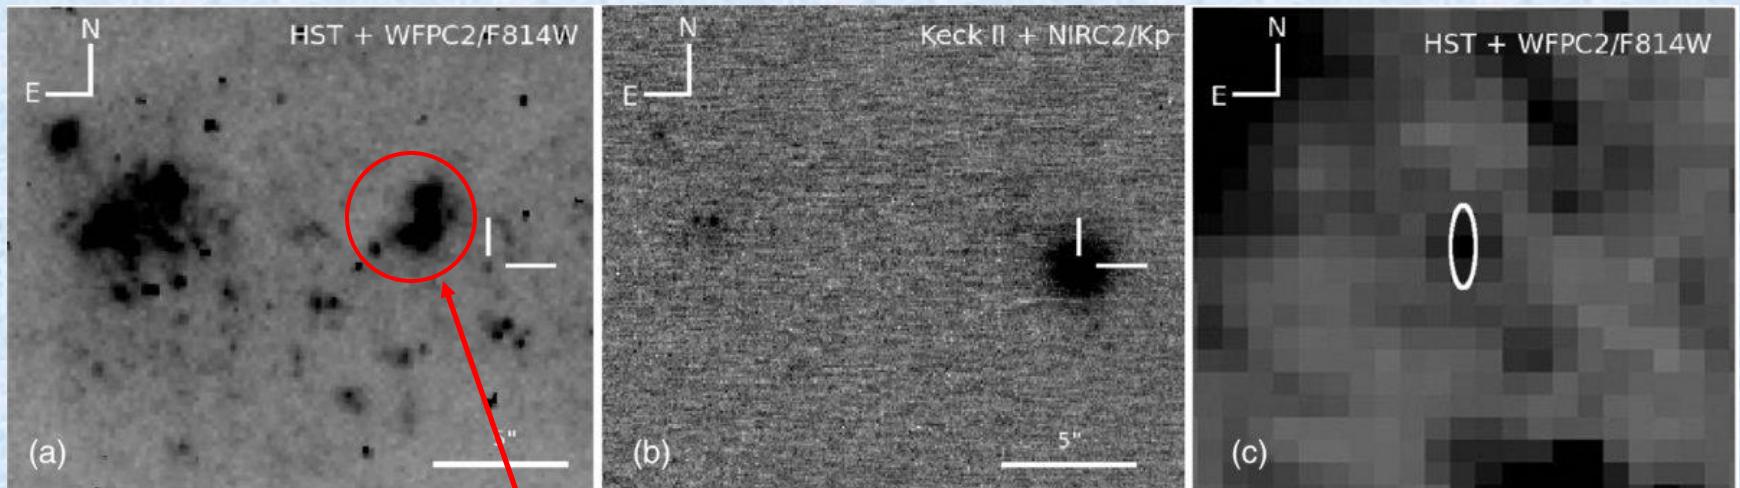

- This SN (with  $M_B = -16.5$ ) most resembles SNe II-L

(Elias-Rosa et al. 2010 --- with A.A. Miller, J.M. Silverman, M. Ganeshalingam, A.F. Boden, M.M. Kasliwal, J. Vinko, J.-C. Cuillandre, T.N. Steele, J.S. Bloom, C.V. Griffith, I.K.W. Kleiser, R.J. Foley)

# The SN II-L 2009kr in NGC 1832

- Progenitor identified using pre-SN HST WFPC2 imaging  
+ post-SN Keck NIRC2 + AO imaging

(HII region = source of spectral narrow lines)

$A_V=0.25$  mag (from Na I D in high-res CFHT spectrum)

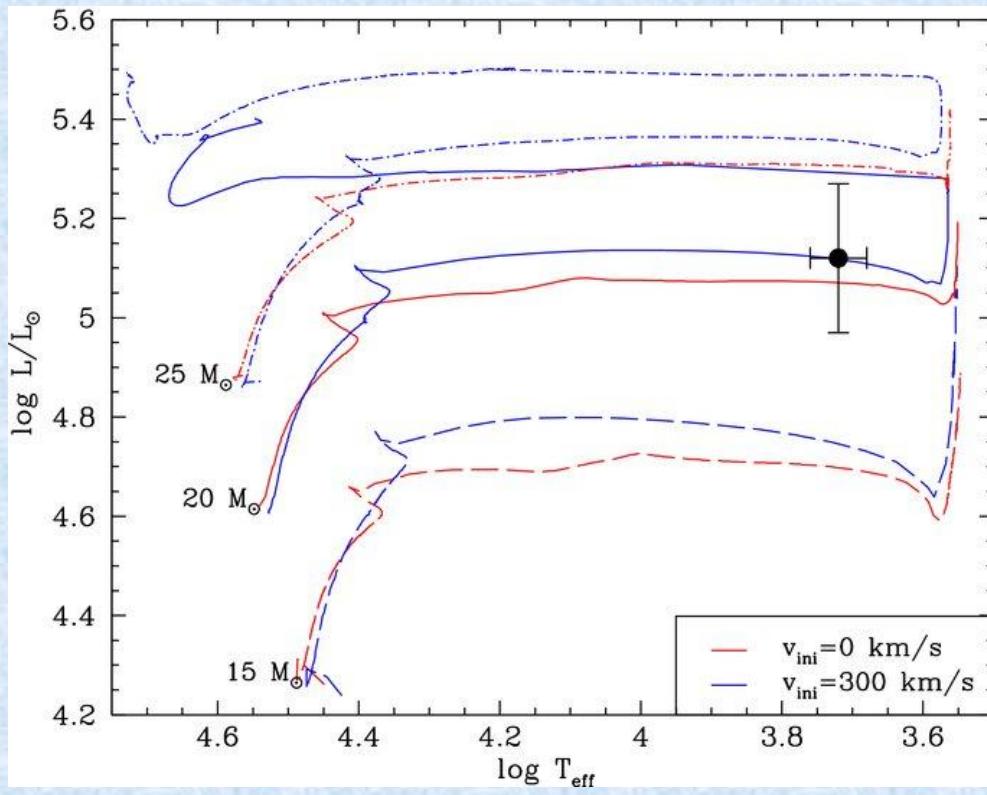

Distance=26.2 Mpc (from cz corrected for Virgo infall)

Solar metallicity from HII region emission lines

(Elias-Rosa et al. 2010)

# The SN II-L 2009kr in NGC 1832

- Progenitor initial mass:  $M_{\text{ini}} \approx 18 \text{--} 24 M_{\odot}$

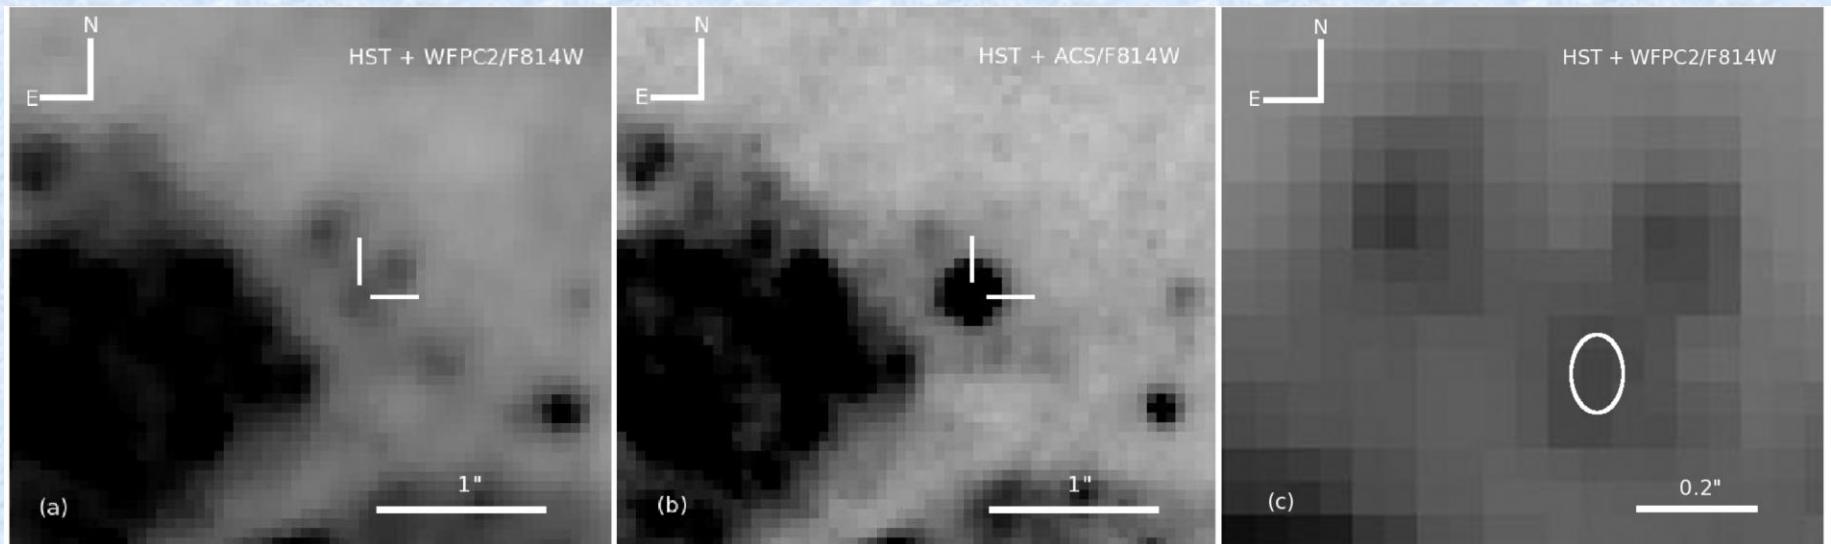

- First-ever detection of SN II-L progenitor
  - Yellow supergiant: consistent with predictions of Geneva rotating models
- Consistent with SN 1980K progenitor ( $M_{\text{ini}} < 20 M_{\odot}$ )
- Consistent with SN 1979C progenitor ( $M_{\text{ini}} > 17\text{--}18 M_{\odot}$ )

(Elias-Rosa et al. 2010)

# The SN II-L 2009hd in M66

- Progenitor identified using pre-SN WFPC2/post-SN ACS imaging

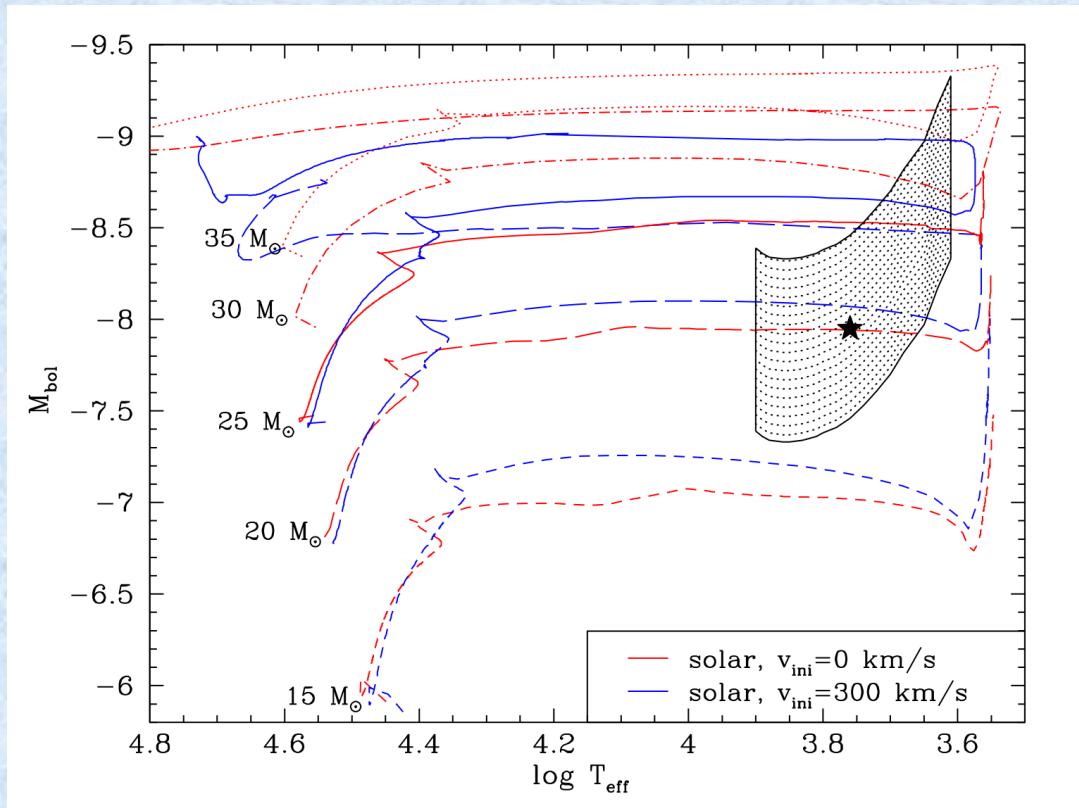

$$A_V = 3.60 \pm 0.15 \text{ mag}$$

Distance = 9.4 Mpc (from Cepheids)

(Elias-Rosa et al. 2010b)

# The SN II-L 2009hd in M66

- Progenitor initial mass:  $M_{\text{ini}} \approx 16 \text{--} 35 M_{\odot}$

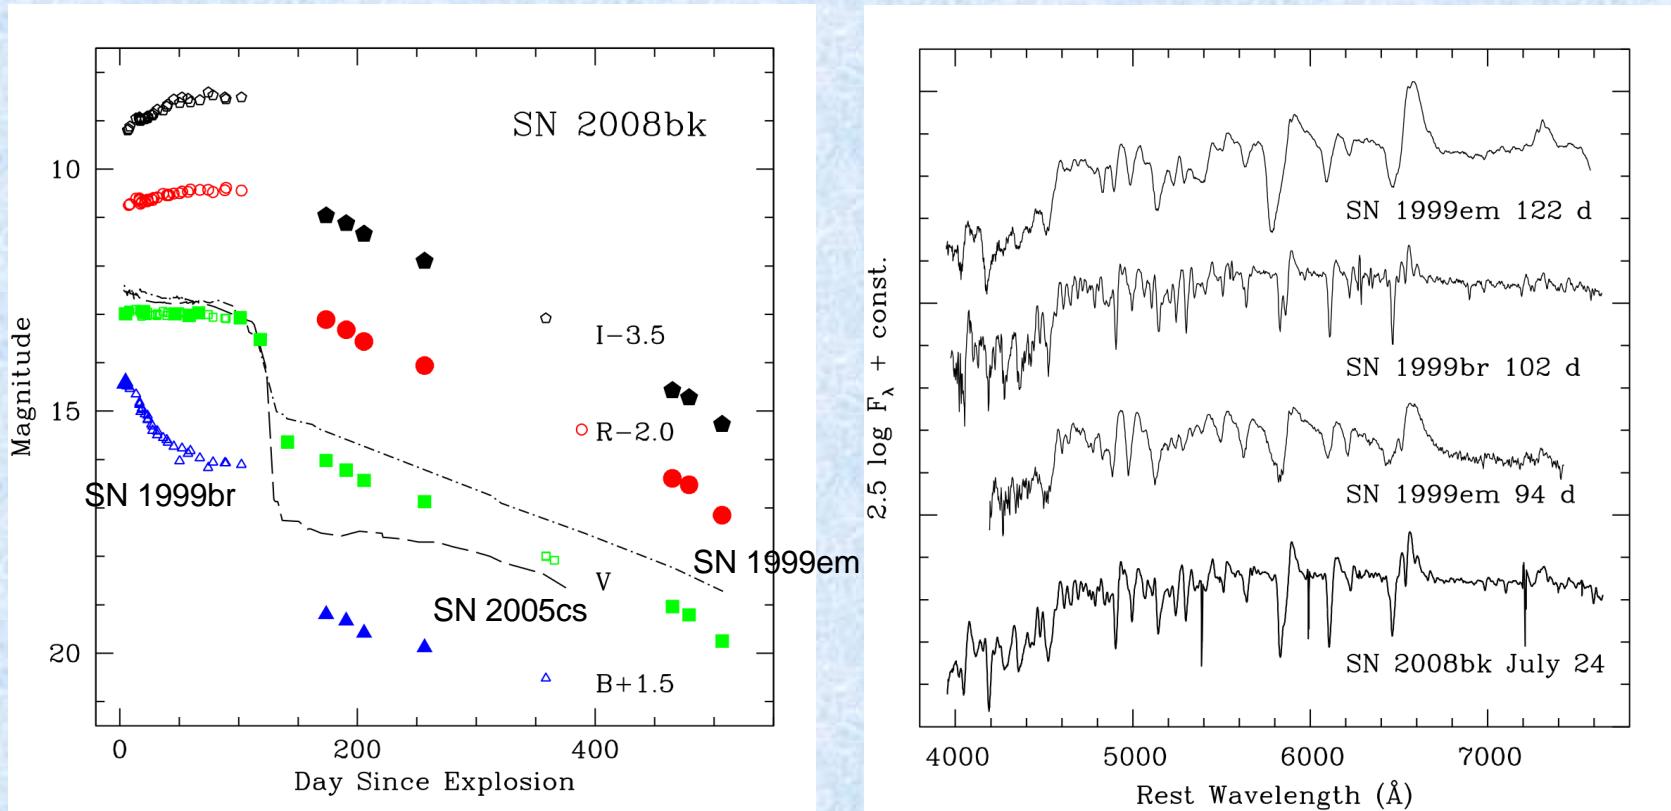

- Initial mass highly unconstrained, due to large uncertainty in F555W photometry
- However, progenitor could still be quite yellow

(Elias-Rosa et al. 2010b)

# The SN II-P 2008bk in NGC 7793

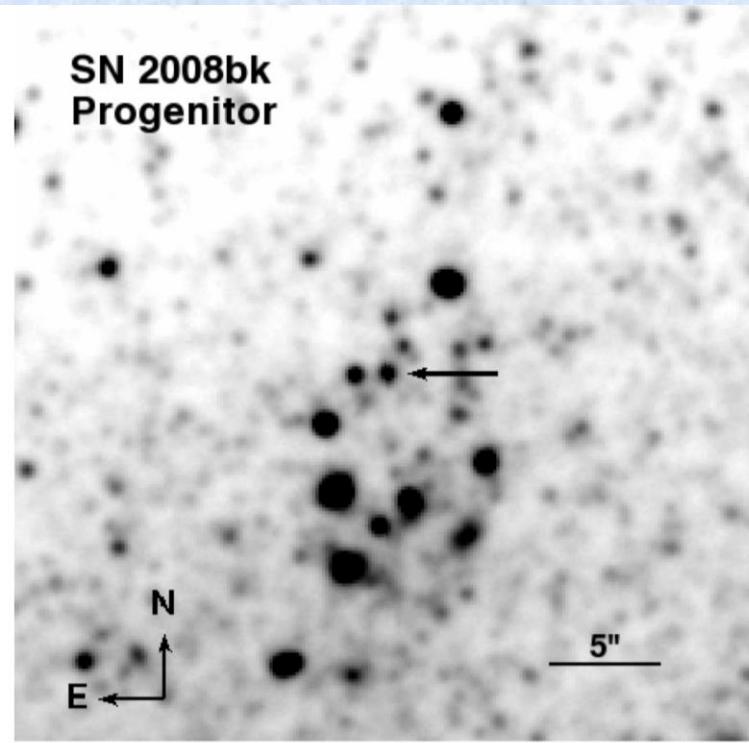

- “Kissing cousin” of subluminous SN II-P 1999br in NGC 4900

(Van Dyk et al. 2010 --- with T.J. Davidge, S. Taubenberger, S. Howerton, N. Morrell,  
G. Pignata, M. Hamuy)

# The SN II-P 2008bk in NGC 7793

- Progenitor characterized from Gemini-S GMOS g'r'i' images

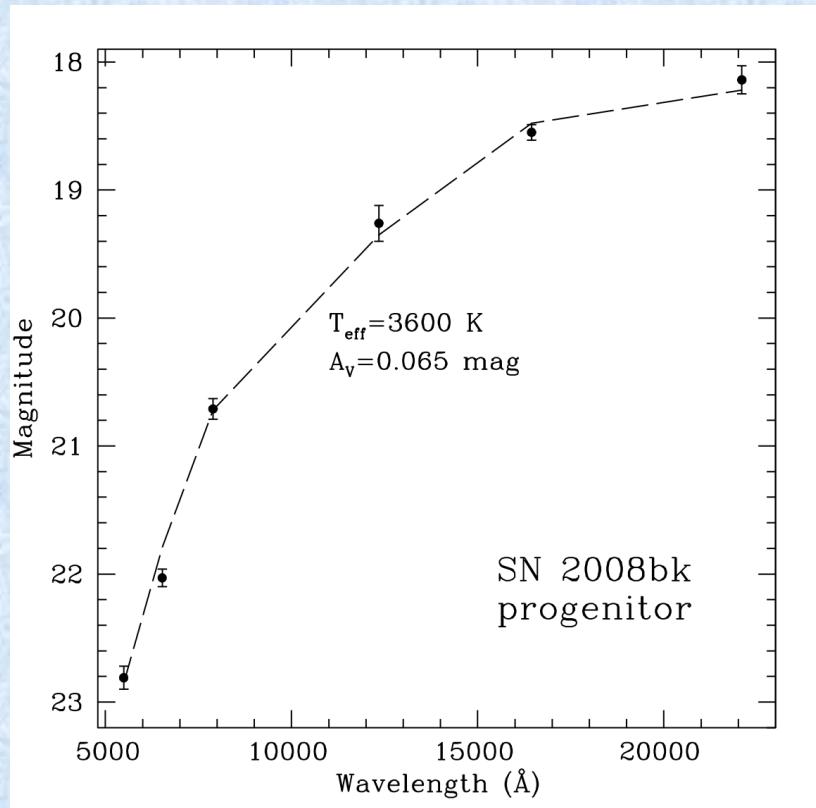

Progenitor ID'ed by Li et al. (2008), Maoz & Mannucci (2008),  
Mattila et al. (2008)

(Van Dyk et al. 2010)

# The SN II-P 2008bk in NGC 7793

- Progenitor SED beautifully matched by that of M3 supergiant

VRI mags transformed from  
g'r'i' mags

$A_V = 0.065 \text{ mag}$   
(~entirely Galactic  
Foreground)

$\mu_0 = 28.00 \pm 0.10$   
from rederived TRGB  
(distance=3.98 Mpc)

Solar metallicity from spectrum  
of HII region in environment

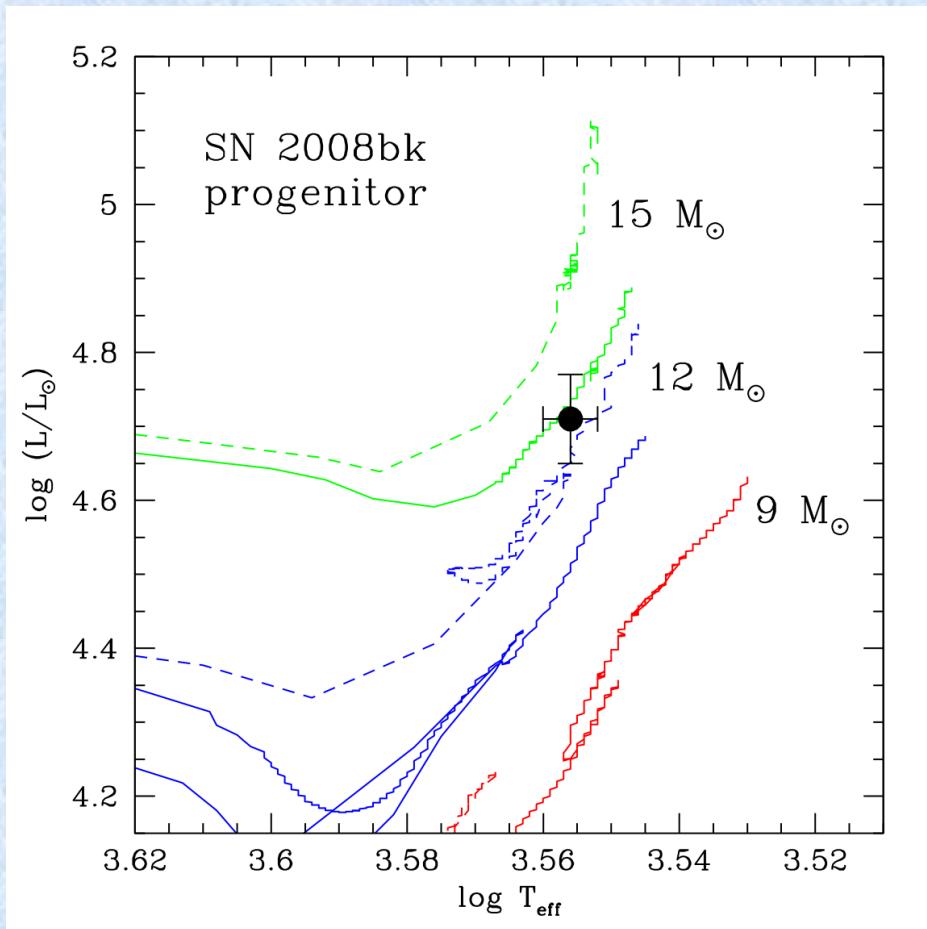

$$M_{\text{bol}} = -7.00 \pm 0.13 \text{ from V}$$

$$M_{\text{bol}} = -7.03 \pm 0.15 \text{ from K}$$

(Van Dyk et al. 2010)

# The SN II-P 2008bk in NGC 7793

- Progenitor initial mass:  $M_{\text{ini}} = 12 \text{--} 15 M_{\odot}$

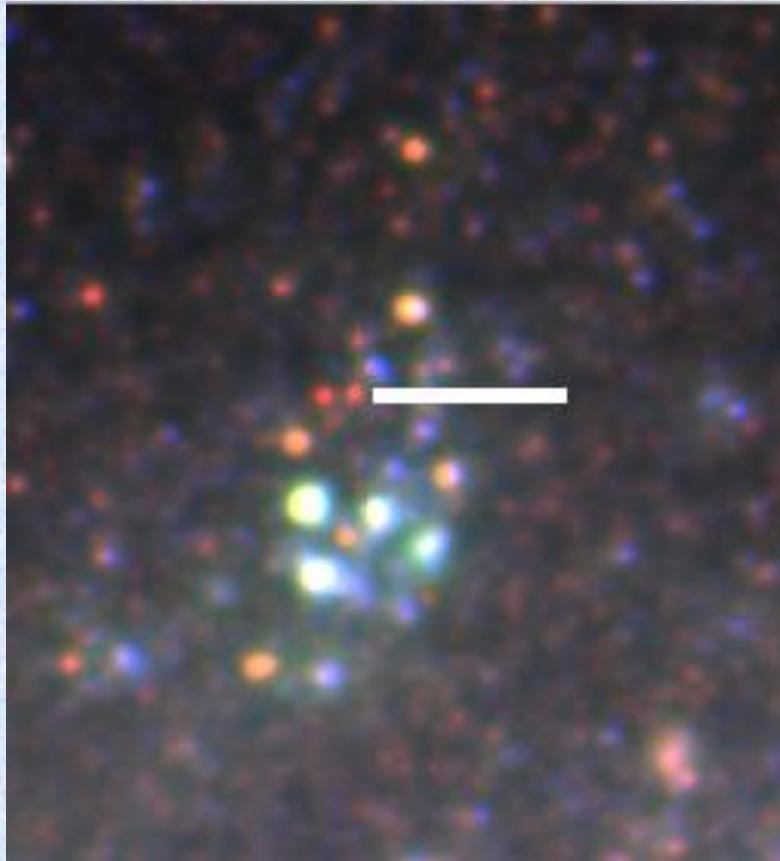

- Next to SN 1987A, the least ambiguous detection so far
- Consistent with SN 1999br progenitor ( $M_{\text{ini}} < 15 M_{\odot}$ )
  - for 08bk,  $M_V = -15.1$  mag
  - for 99br,  $M_V = -13.8$  mag  
(from EPM distance,  
 $M_V = -16.3$  mag)

(Van Dyk et al. 2010)

# The SN II-P 2008bk in NGC 7793

- The second least ambiguous detection so far

Gemini g'r'i' from 2007 Sep-Oct  
(Van Dyk et al. 2010)

NOT VRI from 2009 Aug

# Summary

- SN 2008cn progenitor: yellow supergiant with  $\square M_{\text{ini}} \approx 17 \pm 2 M_{\odot}$  (? Binary? Blend? Undetected?)
- SN 2009kr, first ID of a SN II-L progenitor: yellow supergiant with  $M_{\text{ini}} \approx 18 -- 24 M_{\odot}$
- SN 2009hd progenitor  $M_{\text{ini}}$  not well constrained

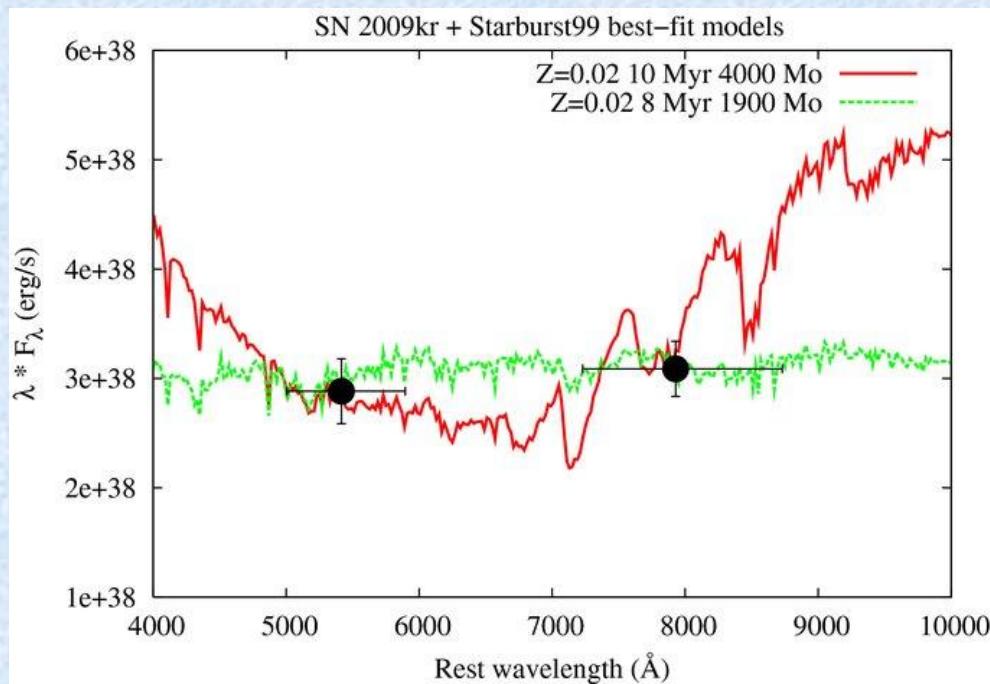

***All above are very likely to be CSM interactors***

- SN 2008bk had a M3 supergiant progenitor, with  $M_{\text{bol}} = -7.0$  and  $M_{\text{ini}} = 12 -- 15 M_{\odot}$
- SN 2008bk, best ID since SN 1987A
- SN Ib/c progenitors hard to detect: either in clusters or extinguished by dust -- *maybe, someday we'll get lucky*

# Extras

# The SN II-L 2009kr in NGC 1832

- Possible cluster

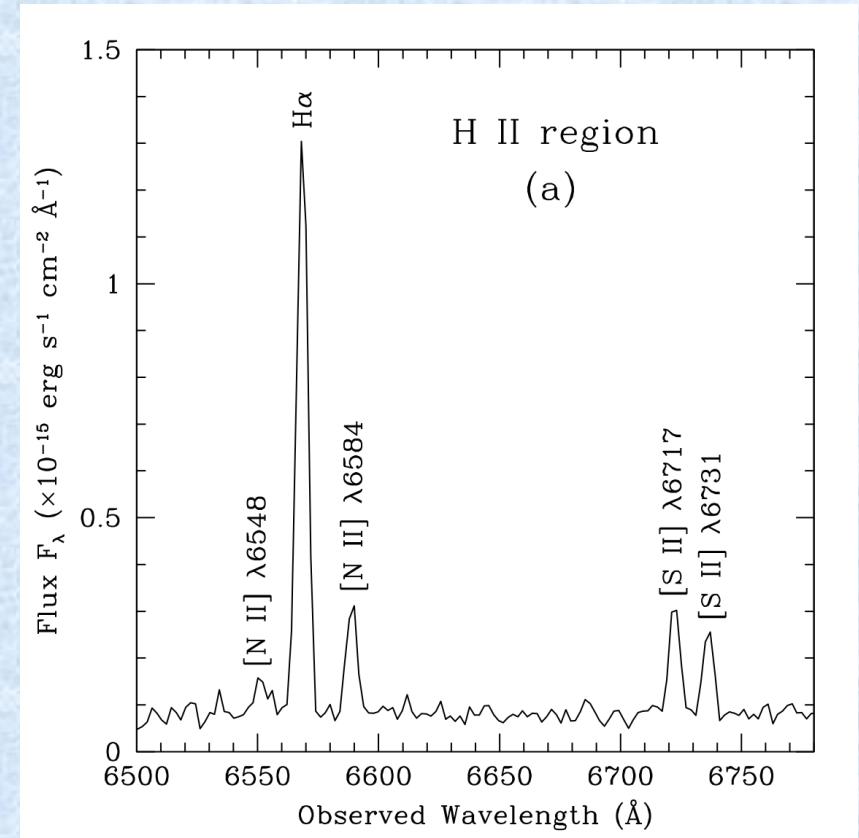

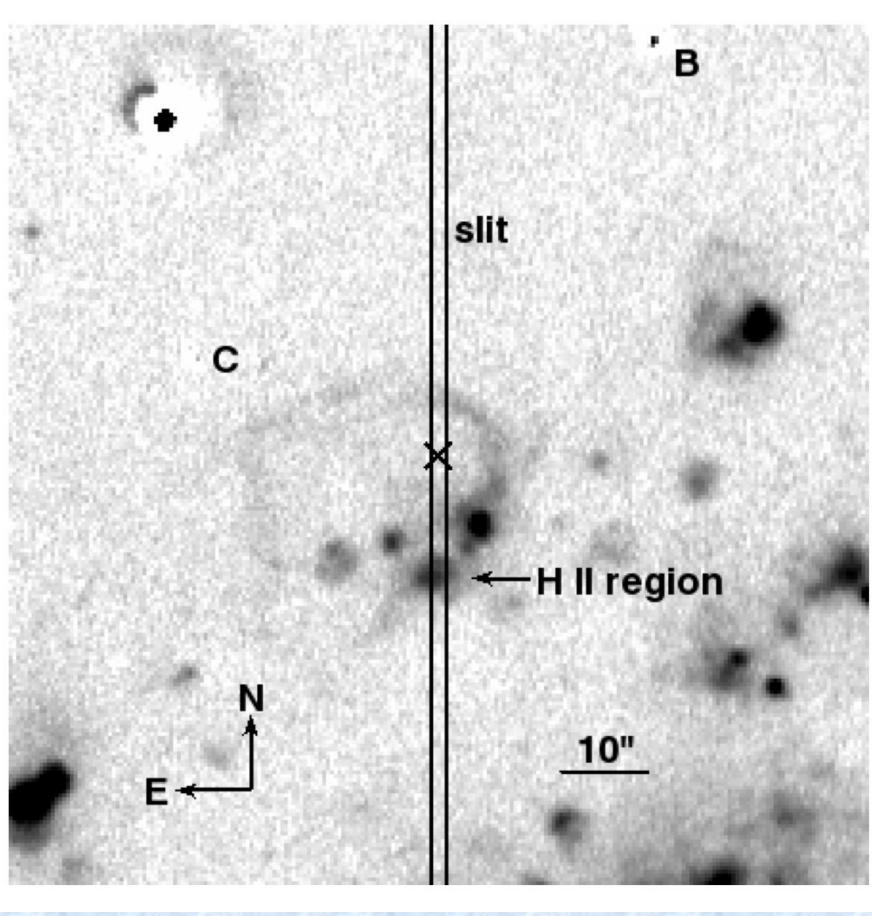

(Elias-Rosa et al. 2010)

- 10 Myr cluster still consistent with progenitor of  $M_{\text{ini}} \sim 20 M_\odot$ , with  $M_{\text{min}}(\text{cluster}) \sim -7.6$  mag
- 8 Myr cluster also fits, with  $M_{\text{min}}(\text{cluster}) \sim -8.1$  mag
- Star:  $M_v < -7.8$  mag
- We would expect  $M_v < -8.6$  mag for clusters (Bastian et al. 2005)

# The SN II-P 2008bk in NGC 7793

- HII region in SN environment and its spectrum

(Van Dyk et al. 2010)

# Humphreys-Davidson Limit

- Loci of progenitors of SNe 2009kr and 2009hd
